数学猜想与开放问题

第二卷：第一卷之外的补充目录

80,537

条经规则筛查保留的补充记录

79,521 条题名与摘录 / 1,016 条形式化研究声明

对照第一卷 17,614 条记录筛查；并附来源、状态、排除日志与机器可读数据

由中国跨学科学者 沈阳　　124739259@qq.com　　调度 AI 生成

整理日期：2026 年 10 月 25 日（Asia/Shanghai）

“剩余”以本次已取得语料及筛查规则为边界，不是人类数学猜想的剩余全集。

01 本卷收录了什么

本卷承接第一卷的 17,614 条记录，继续搜集其他公开来源。正文逐条列出筛查后保留的 80,537 条补充记录。这个数能够核对到具体来源和编号，但不等于 80,537 个已确认彼此独立、且第一卷绝未涉及的数学猜想。

组成	条数	读者实际得到的内容
MathDB 公开目录摘录	79,521	题名、来源原样摘录、原编号、状态标签与页面链接；不能保证包含完整条件或结论。
Formal Conjectures 研究声明	1,016	原注释、Lean 声明节选、模块背景和官方源代码链接；研究已解决项也单独标明。
正文合计	80,537	80,537 个不同来源主键。不是全球总数，也不是数学语义等价类的精确数。

“全部剩余”的可实现边界

全球没有一份经过统一登记、语义去重并持续核验的猜想总账。未发表内容、语言差异、一个问题的多个版本及新出现的文献都可能超出本次观察。本卷完整列出的是本次取得的两组语料经列明规则筛查后的保留记录；不能证明数学界其他未收录猜想已不存在。

与第一卷一起使用时

第一卷适合查阅所收录问题的 statement 字段；第二卷主要扩大检索入口。两卷条数可以用于核对文档规模，不能相加后称为“人类猜想总数”。若用于研究选题，请打开单条记录的来源页核对完整表述、最新进展和原文献。

02 如何排除第一卷内容

排除基准为第一卷全部 17,614 条 published=true 记录；另外利用原数据中能够映射回这些主条目的归档别名。按以下顺序处理，前一步排除的记录不再重复计入后一步。

筛查阶段	排除数	规则含义
Formal Conjectures 预筛	3,190	整体排除已覆盖的 Erdős、Green、Kourovka、千禧年、Hilbert 来源族；无法稳妥定位声明者也暂不纳入。
编号、题名或表述匹配	5,279	匹配固定编号、规范化题名、规范化全文或可靠的表述前缀。
文本近似重合，暂不刊入	2,032	标题加权的词/二元词 TF-IDF；与基准最相似记录的余弦值达到 0.58。
卷内同文本筛查	240	MathDB 同摘录文本，或同源形式声明；保留一条并保存替代编号。
追加第一卷匹配	51	形式模块题名、同一 OEIS 序列族，以及人工识别的双曲群剩余有限性问题族。
类型或提取歧义排除	172	164 条 MathDB 的 theorem 类型；8 条无法唯一定位声明的形式记录。
本卷来源之间的重合	15	目录题名/摘录与形式模块匹配，或同一 OEIS 题名族；优先保留形式资料。

可复算等式：87,105 + 4,411 - 3,190 - 5,279 - 2,032 - 240 - 51 - 172 - 15 = 80,537。相似阈值只是筛查工具，既可能漏掉不同表述的同一问题，也可能暂时排除真正不同的变体。不能从“未匹配”推断“数学上已确认不同”。

03 标签、状态与计数限制

来源标签	保留数	含义
MathDB: conjecture	66,658	来源自标为猜想；未经本报告逐条确认其历史、正确性或独立性。
MathDB: open_problem	12,863	来源自标为开放问题；可能是构造、分类、最优值或其他研究问题。
Formal: research open	492	来源元数据标记为开放的研究声明。
Formal: research solved	524	与研究问题相关的已解决声明，也可能是特殊情形、等价式或相关定理；不计为仍未解决的猜想。

MathDB 的状态标签分布

open	claimed_progress	claimed_solved	solved	refuted	partial	special_case
77,731	390	874	283	232	9	2

claimed_solved 只表示有人声称已解决，不能改写为“已证明”。MathDB 明示其平台不验证数学内容；Formal Conjectures 也提示形式化表述可能误表原问题。形式声明中出现 theorem 或存在 Lean 文件，不等于具有已核验的完整证明。[S4, S5]

MathDB 的 17 个学科分组采用 OPDP 汇编附带的 category_label，主要用于检索，属于其分类结果，不是本报告进行的专家分类。Formal Conjectures 则按官方来源集合分组。

04 来源、归属与复用说明

S1 Alejandro Zarzuelo Urdiales / OPDP difficulty atlas，v1.8 数据包

https://github.com/alejandrozu/ulam-opdp-difficulty-atlas

本卷从公开发布的数据包提取 87,105 条 MathDB 目录项；不采用该项目的 AI 难度评分。

S2 OPDP MathDB 扩展记录与快照说明

https://github.com/alejandrozu/ulam-opdp-difficulty-atlas/blob/main/docs/OPDP_v1.7_APPEND_ONLY_NOTES.md

MathDB 来源清单冻结于 2026-09-08，excerpt 字段不保证是完整命题。

S3 OPDP Attribution and provenance notice

https://github.com/alejandrozu/ulam-opdp-difficulty-atlas/blob/main/NOTICE.md

MathDB 数据来源及可用逐条引用信息随记录保留；原始数学材料仍按各自署名与权利说明处理。

S4 MathDB Terms of Service

https://mathdb.com/terms

MathDB 贡献内容（论文除外）声明按 CC BY 4.0 许可；平台明确不对数学内容或声称状态作真实性认证。

S5 Formal Conjectures：官方项目说明

https://google-deepmind.github.io/formal-conjectures/about/

软件 Apache 2.0；其他材料 CC BY 4.0；各文件中的第三方权利说明仍适用。

S6 Google DeepMind / Formal Conjectures 公开源代码库

https://github.com/google-deepmind/formal-conjectures

仅使用 research open / research solved 元数据；代码与注释来自本次下载快照。

05 快照日期与阅读方法

本卷整理日期为 2026-10-25（Asia/Shanghai）。MathDB 数据实际冻结日期为 2026-09-08；Formal Conjectures 元数据与源码为本次检索下载快照。它们不是所有平台在整理日的同步全量状态。

本报告新增的工作包括：第一卷比对、规则筛查、分组、中文导读、排版、页码索引和审计数据；原始数学题名、摘录与代码的归属仍为原作者、MathDB 贡献者及 Formal Conjectures 贡献者。按用户要求，两卷封面注明“由中国跨学科学者 沈阳 124739259@qq.com 调度 AI 生成”。该说明不替代逐条原始来源署名。

如何查找

用 PDF 书签进入来源集合或学科章节；用全文搜索查找题名、MathDB 编号或形式声明名。每条记录有 V2- 六位本卷编号，原来源编号同时保留。链接“MathDB 页面”或“官方代码”指向来源；“原文线索”来自来源字段，未逐一核验。

如何理解正文

MathDB 正文始终标为“摘录”，忠实保留已有文字及省略符号，不补写被截断的公式。英文、LaTeX 和 Lean 源文本保留原语；为了避免改写数学含义，不把公式自动翻译为新表述。Formal Conjectures 中的模块背景只在同模块首次出现时刊出；后续声明可回看该模块，并查阅嵌入的原始 .lean 文件及依赖。

PDF 内嵌审计包

附件 volume2_records_and_audit.zip 包含全部保留记录（JSONL）、原始可用字段、排除日志、来源快照哈希、页码映射与筛查脚本；另含所用形式模块及许可证。若阅读器不显示附件，请使用支持 PDF 附件的桌面阅读器。JSONL 保存原始 Unicode；正文中极少数缺字用 [U+编码] 明示，不暗中删去。

没有读取付费完整 MathDB 数据包，本卷 MathDB 内容不是全文恢复版。含省略号的摘录无法独立承担严谨的数学定义和证明；应返回原论文或完整页面。

research open | proof annotation: False | 官方代码 | 原文线索

Problem 10.3. To prove that there exists a positive real number~c such that $\lVert e^n \rVert > e^{-cn}$, for every~$n \ge 1$. Posed by Mahler [Mah53].

theorem problem_10_3 :
∃ c : ℝ, 0 < c ∧ ∀ n : ℕ, 1 ≤ n → Real.exp (-c * n) < distToNearestInt (Real.exp n)

FC-Bugeaud01.problem_10_3

V2-000005 | Bugeaud Collection of Conjectures and Open Questions: Fractional Parts of Powers | waldschmidt

research open | proof annotation: False | 官方代码 | 原文线索

Waldschmidt [Wal03] conjectured that a stronger result holds, namely that there exists a positive real number~c such that $\lVert e^n \rVert > n^{-c}$ for every~$n \ge 2$. This is supported by metrical results [Kok45]. Note: the bound n^{-c} equals 1 when $n = 1$ for all c, while the distance to the nearest integer is always at most $1/2$, so the conjecture must start at $n \ge 2$.

theorem waldschmidt :
∃ c : ℝ, 0 < c ∧ ∀ n : ℕ, 2 ≤ n → (n : ℝ) ^ (-c) < distToNearestInt (Real.exp n)

Bugeaud Collection of Conjectures and Open Questions: Automatic Expansions in Two Bases

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Automatic Expansions in Two Bases Problem 10.32 asks whether some irrational real number has automatic expansions in two multiplicatively independent bases. The answer is no. Adamczewski and Faverjon [AF20] proved it with the multivariate Mahler method, in a form that is stronger than the question asked: the base-b digit sequence may be k-automatic for an arbitrary $k \ge 2$, not only for $k = b$. The definitions used here are in `FormalConjecturesForMathlib`: `Nat.MultiplicativelyIndependent` and `Nat.MultiplicativelyIndependentFamily`, `AutomaticSequence.IsAutomatic`, `AutomaticSequence.IsAutomaticInBase` and `AutomaticSequence.IsBroadlyAutomaticInBase`. *References:* - [AF20](https://arxiv.org/abs/2012.08283) Adamczewski, Boris, and Colin Faverjon. "Mahler's method in several variables and finite automata." arXiv:2012.08283 (2020). Appendix A, Conjectures A.2 and A.3, both proved there from Part (i) of Theorem 1.1. - [AS03] Allouche, Jean-Paul, and Jeffrey Shallit. "Automatic Sequences: Theory, Applications, Generalizations." Cambridge University Press, 2003. Chapter 13, Open Problems 7, p. 403, is the problem that Problem 10.32 modifies. - [Bug12] Bugeaud, Yann. "Distribution modulo one and Diophantine approximation." Vol. 193. Cambridge University Press, 2012. Chapter 10. - [Cob69] Cobham, Alan. "On the base-dependence of sets of numbers recognizable by finite automata." Mathematical Systems Theory 3 (1969): 186-192. - [LvdP82] Loxton, John H., and Alfred J. van der Poorten. "Arithmetic properties of the solutions of a class of functional equations." Journal für die reine und angewandte Mathematik 330 (1982): 159-172. Its transcendence method was the first attack on the problem; Nishioka later reported a gap in its main proof.

V2-000006 | Bugeaud Collection of Conjectures and Open Questions: Automatic Expansions in Two Bases | adamczewski_faverjon

research solved | proof annotation: False | 官方代码 | 原文线索

Adamczewski-Faverjon [AF20, Conjecture A.3], proved there from Part (i) of Theorem 1.1. Let $b_1, \dots, b_r$ be multiplicatively independent positive integers, and for every i let ξ_i be a real number that is automatic in base b_i. Then $\xi_1, \dots, \xi_r$ are algebraically independent over $\mathbb{Q}$, unless one of them is rational. Two points of fidelity. The hypothesis is the *joint* multiplicative independence of $b_1, \dots, b_r$ that [AF20] defines on p. 3 (no nonzero integer tuple (n_i) has $\prod_i b_i^{n_i} = 1$), not the weaker pairwise condition; it is what the proof feeds to Part (i) of Theorem 1.1, via the multiplicative independence of $1/b_1, \dots, 1/b_r$. Automaticity is the broad notion that the proof of Conjecture A.3 uses: the base-b_i digits of ξ_i are k-automatic for some $k \ge 2$, which need not be b_i.

```
theorem adamczewski_faverjon {r : ℕ} (b : Fin r → ℕ) (hb : ∀ i, 2 ≤ b i)
(hind : Nat.MultiplicativelyIndependentFamily b)

Bugeaud Collection of Conjectures and Open Questions: Spectrum of Sequence

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Spectrum of Sequence *References:* - [Bug12] Bugeaud, Yann. "Distribution modulo one and Diophantine approximation." Vol. 193. Cambridge University Press, 2012. Chapter 10. - [Men73] Mendès France, Michel. "Les ensembles de Bésineau." Séminaire Delange-Pisot-Poitou 15.1 (1973): 1-6. - [Özc26] Özcan, Hikmet Burak. "The spectrum of $(\xi\alpha^n)$ can be uncountable." [arXiv:2609.07714](https://arxiv.org/abs/2609.07714) (2026). ## Counterexample Problem 10.4 is false. Özcan [Özc26] proves that for every real $\alpha > 1$ there are $2^{\aleph_0}$ reals $\xi > 0$ whose spectrum contains one and the same uncountable set. The counterexample below is an independent, self-contained instance of this for the base $\alpha = 64$, where the digits of ξ can be prescribed directly. For a bit sequence $u \in \{0, 1\}^{\mathbb{N}}$ put $$\theta_u = \sum_{i \ge 0} (1 + u_i) \, 8^{-e(i)}, \qquad e(i) = 4^{i+1} + i + 6.$$ The map $u \mapsto \theta_u$ is injective with values in $(0, 1)$. Split the indices into the blocks $[5 m_k, 6 m_k)$ with $m_k = 20 \cdot 8^k$; these are pairwise disjoint. Block number $k = \langle L, c \rangle$, where $\langle \cdot, \cdot \rangle$ is the Cantor pairing, is reserved for the bit string c of length L. On that block the base-64 digits of ξ are chosen so that $\{\xi 64^n\}$ shadows $\{n \theta\}$ for every θ whose first L bits are c. This is possible because one base-64 digit pins down $\{\xi 64^n\}$ up to $2/64$, and because $k \le 4^{L+1}$ forces the block to sit far to the left of the precision $8^{-e(L)}$ of the truncation of θ, so that n times the truncation error stays below $1/512$ on the block. Consequently $\{\xi 64^n - n \theta_u\} < 1/10$ for all n in the block attached to the first L bits of u, for every L. That block is the last sixth of $[0, 6 m_k)$, so at the times $N = 6 m_k - 6$ at most a proportion $5/6$ of the points $\{\xi 64^n - n\theta_u\}$ with $n < N$ lies in $[1/10, 1]$, whereas uniform distribution modulo one would force the proportion $9/10$. Hence every irrational θ_u lies in the spectrum of $(\xi 64^n)$, and since $\{\theta_u\}$ is uncountable the spectrum cannot be countable.

V2-000008 | Bugeaud Collection of Conjectures and Open Questions: Spectrum of Sequence | spectrum_xi_alpha_pow_countable

research solved | proof annotation: True | 官方代码 | 原文线索

Problem 10.4. Let ξ be a non-zero real number and $\alpha > 1$ be a real number. Is the spectrum of the sequence $(\xi \alpha^n)_{n \ge 1}$ at most countable? Posed by Mendès France [Men73]. The answer is no. Özcan [Özc26] disproved this for every $\alpha > 1$; the counterexample formalised here takes $\alpha = 64$ and the real number $\xi = $ `xiVal`, whose spectrum contains the uncountable set of irrational numbers of the form `thetaSeq u`.

theorem spectrum_xi_alpha_pow_countable :
¬ ∀ (ξ : ℝ), ξ ≠ 0 → ∀ (α : ℝ), 1 < α → (Spectrum (fun n => ξ * α ^ n)).Countable

Bugeaud Collection of Conjectures and Open Questions: Lacunary Sequences in Real Number Fields

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Lacunary Sequences in Real Number Fields The following problems were proposed and discussed by Dubickas as Conjecture 2 in [Dub09]. *References:* - [Bug12] Bugeaud, Yann. "Distribution modulo one and Diophantine approximation." Vol. 193. Cambridge University Press, 2012. Chapter 10. - [Dub09] Dubickas, Artūras. "An approximation property of lacunary sequences." Israel Journal of Mathematics 170.1 (2009): 95-111.

V2-000009 | Bugeaud Collection of Conjectures and Open Questions: Lacunary Sequences in Real Number Fields | problem_10_5

research solved | proof annotation: True | 官方代码 | 原文线索

Problem 10.5 (first part). Let $\mathbb{K}$ be a real number field. Then, for any $\varepsilon > 0$, there exists a lacunary sequence $(t_n)_{n \ge 1}$ of positive numbers in $\mathbb{K}$ such that $$\limsup_{n \to \infty} \{\xi t_n\} \ge 1 - \varepsilon,$$ for any real number ξ not in $\mathbb{K}$. This follows from the stronger `problem_10_5_moreover` via `problem_10_5_of_moreover`. A Lean 4 formalization by Kenta Kitamura ([KitaKen1 on GitHub](https://github.com/KitaKen1)) is available at [KitaKen1/bugeaud-10-5-lacunary](https://github.com/KitaKen1/bugeaud-10-5-lacunary).

theorem problem_10_5 (K : IntermediateField ℚ ℝ) [FiniteDimensional ℚ K]
{ε : ℝ} (hε : 0 < ε) :
∃ t : ℕ → K, (∀ n, 0 < (t n : ℝ)) ∧
IsLacunaryReal (fun k => (t k : ℝ)) ∧
∀ ξ : ℝ, ξ ∉ K →
(1 - ε) ≤ limsup (fun n => Int.fract (ξ * (t n : ℝ))) atTop

FC-Bugeaud05.problem_10_5

V2-000010 | Bugeaud Collection of Conjectures and Open Questions: Lacunary Sequences in Real Number Fields | problem_10_5_moreover

research solved | proof annotation: True | 官方代码 | 原文线索

Problem 10.5 ("moreover" clause). With the same hypotheses as `problem_10_5`, the sequence (t_n) can be chosen so that, for any real ξ not in $\mathbb{K}$, each subinterval of $[0, 1]$ of length ε contains a limit point of the sequence $(\{\xi t_n\})_{n \ge 1}$. This is strictly stronger than `problem_10_5`: the limsup bound is the special case at the subinterval $[1 - \varepsilon, 1]$. A Lean 4 formalization by Kenta Kitamura ([KitaKen1 on GitHub](https://github.com/KitaKen1)) proves this statement using the explicit positive integer sequence $$t_{Jk+r} = (J+r)2^k \qquad (k \ge 0,\ 0 \le r < J).$$ Here Q is a positive integer chosen so that $Q > 1/\varepsilon$, and $J = 10Q!$. Since $\mathbb{K}$ contains $\mathbb{Q}$, every term belongs to $\mathbb{K}$. The proof verifies that this sequence is lacunary and has the required cluster-point property simultaneously for every $\xi \notin \mathbb{K}$. See [KitaKen1/bugeaud-10-5-lacunary](https://github.com/KitaKen1/bugeaud-10-5-lacunary).

theorem problem_10_5_moreover (K : IntermediateField ℚ ℝ) [FiniteDimensional ℚ K]
{ε : ℝ} (hε : 0 < ε) :
∃ t : ℕ → K, (∀ n, 0 < (t n : ℝ)) ∧
IsLacunaryReal (fun k => (t k : ℝ)) ∧
∀ ξ : ℝ, ξ ∉ K → ∀ a, a ∈ Set.Icc (0 : ℝ) (1 - ε) →
∃ y ∈ Set.Icc a (a + ε),
MapClusterPt y atTop (fun n => Int.fract (ξ * (t n : ℝ)))

FC-Bugeaud05.problem_10_5_moreover

Bugeaud Collection of Conjectures and Open Questions: Simultaneously Small Entropies

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Simultaneously Small Entropies A real number can be described by its continued fraction expansion and by its expansion in an integer base. Problem 10.53 asks for an irrational number for which both descriptions have small block complexity. Temur [Tem26] answered it, in the stronger form that asks for every base at once, by an explicit construction. *References:* - [Bug12] Bugeaud, Yann. "Distribution modulo one and Diophantine approximation." Vol. 193. Cambridge University Press, 2012. Chapter 10. - [Tem26](https://arxiv.org/abs/2609.16362) Temur, Faruk. Bugeaud Collection of Conjectures and Open Questions: Rapidly Increasing Sequences Dense Modulo One

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Rapidly Increasing Sequences Dense Modulo One Problem 10.6 asks for a "very rapidly increasing" sequence $(m_n)_{n \ge 1}$ of positive integers with $(\{\xi m_n\})_{n \ge 1}$ dense modulo one for every irrational ξ. The informal phrase admits several readings, and they are not equivalent: * a lower bound on the size of the terms, $m_n \ge f(n)$; * an upper bound on the counting function of $\{m_n\}$; * a lower bound on the consecutive ratios, $m_{n+1}/m_n \ge 1 + c/\log n$. The first two readings are vacuous, and `exists_dense_of_growth_and_sparsity` below says so: a sequence built from runs of consecutive integers is dense modulo one for every irrational ξ by an elementary argument, and the runs may be placed so that its terms dominate any prescribed f while its counting function stays below $(\log\log N)^2$. In the subexponential range the growth half is a special case of [Bos83, Thm. 1.5], which produces such a sequence in any prescribed subexponential corridor and in the stronger uniform-distribution form; the sparsity half sits below the $\log N$ floor that every sublacunary sequence obeys, and so below the counting function of [Kat16, Cor. 4.10]. Consequently `problem_10_6_variant_2`, which asks only for intermediate growth, is not open. The third reading is `IsGenuinelySublacunary`, and it is the only one with content: it implies the first (`hasIntermediateGrowth_of_isGenuinelySublacunary`), and it is not answered by runs, since inside a run $m_{n+1} - m_n = 1$. That reading is `problem_10_6_variant_1`, which remains open; [Kat16, Cor. 4.9] gives a universally densifying sequence of multiplicative shape $\{2^n 3^e\}$ whose ratio behaviour reduces the question to a Diophantine statement about $\log_2 3$. The three statements that need a long proof carry a `formal_proof` link to the version of this file that contains it: the construction by runs, its counting function, and the growth estimate behind `hasIntermediateGrowth_of_isGenuinelySublacunary`. *References:* - [Bos83] Boshernitzan, Michael D. V2-000013 | Bugeaud Collection of Conjectures and Open Questions: Rapidly Increasing Sequences Dense Modulo One | exists_dense_of_growth

research solved | proof annotation: True | 官方代码

A lower bound on the size of the terms cannot make Problem 10.6 nontrivial. For every growth demand `f` there is a strictly increasing sequence dominating `f` at every index which is dense modulo one for every irrational ξ. In the subexponential range this is a special case of [Bos83, Thm. 1.5], which produces such a sequence inside any prescribed corridor $[n_k, m_k)$ with $m_k - n_k \to \infty$ and $m_k / n_k \to 1$, and in the stronger form of uniform distribution; the elementary construction of the linked proof is uniform in `f` and has no growth ceiling.

```
theorem exists_dense_of_growth (f : ℕ → ℕ) :
∃ m : ℕ → ℕ, StrictMono m ∧ (∀ n, f n ≤ m n) ∧
∀ ξ : ℝ, Irrational ξ →
Dense (Set.range fun n => (↑(ξ * m n) : AddCircle (1 : ℝ)))
```

FC-Bugeaud06.exists_dense_of_growth

V2-000014 | Bugeaud Collection of Conjectures and Open Questions: Rapidly Increasing Sequences Dense Modulo One | exists_dense_of_growth_and_sparsity

research solved | proof annotation: True | 官方代码

Neither can an upper bound on the counting function, even together with the growth demand. The same sequence dominates an arbitrary `f` *and* has counting function below $(\log\log N)^2$ - an exponential below the $\log N$ floor that every sublacunary sequence obeys, and so below the counting function of [Kat16, Cor. 4.10]. So a reading of "very rapidly increasing" that constrains only the size of the terms or the sparsity of their range leaves Problem 10.6 with no content.

```
theorem exists_dense_of_growth_and_sparsity (f : ℕ → ℕ) :
∃ m : ℕ → ℕ, StrictMono m ∧ (∀ n, f n ≤ m n) ∧
(∀ᶠ N : ℕ in atTop, (countingFn m N : ℝ) ≤ (Real.log (Real.log N)) ^ 2) ∧
∀ ξ : ℝ, Irrational ξ →
Dense (Set.range fun n => (↑(ξ * m n) : AddCircle (1 : ℝ)))
```

Problem 10.6. Find a very rapidly increasing sequence $(m_n)_{n \ge 1}$ of positive integers such that $(\{\xi m_n\})_{n \ge 1}$ is dense modulo one for every irrational number ξ. Note: Furstenberg's 2^m3^n is sublacunary but requires two parameters. This is the reading of "very rapidly increasing" as a lower bound on the consecutive ratios, and it is the one that remains open. It is not answered by runs of consecutive integers, since inside a run $m_{n+1} - m_n = 1$; and by `not_isLacunary_of_dense` any answer is pinched between a decaying ratio floor and the failure of lacunarity. [Kat16, Cor. 4.9] gives a universally densifying sequence of the multiplicative shape $\{2^n 3^e\}$, for which the ratio condition reduces to a Diophantine statement about the differences of the exponents e times $\log_2 3$ modulo one.

```
theorem problem_10_6_variant_1 :
∃ m : ℕ → ℕ,
StrictMono m ∧
IsGenuinelySublacunary m ∧
∀ ξ : ℝ, Irrational ξ →
Dense (Set.range fun n => (↑(ξ * m n) : AddCircle (1 : ℝ)))
```

FC-Bugeaud06.problem_10_6_variant_1

V2-000018 | Bugeaud Collection of Conjectures and Open Questions: Rapidly Increasing Sequences Dense Modulo One | problem_10_6_variant_2

research solved | proof annotation: False | 官方代码

Problem 10.6, intermediate-growth variant. This asks only for a lower bound on the size of the terms, and under that reading the problem is not open: runs of consecutive integers answer it, by `exists_dense_of_growth` applied to $f(n) = \lceil e^n \rceil$. The witness below is exhibited at $\alpha = 1/2$; the same sequence works for every $\alpha < 1$, since $\exp(n^\alpha) \le \exp(n) \le f(n)$ there. The result is not new: [Bos83, Thm. 1.5] gives a sequence of any prescribed subexponential growth that is uniformly distributed - not merely dense - modulo one for every irrational dilate.

```
theorem problem_10_6_variant_2 :
∃ m : ℕ → ℕ,
StrictMono m ∧
(∃ α : ℝ, 0 < α ∧ α < 1 ∧ HasIntermediateGrowth α m) ∧
∀ ξ : ℝ, Irrational ξ →
Dense (Set.range fun n => (↑(ξ * m n) : AddCircle (1 : ℝ)))
```

Bugeaud Collection of Conjectures and Open Questions: Pisot orbits on the Cantor set

MODULE CONTEXT: # Bugeaud Collection of Conjectures and Open Questions: Pisot orbits on the Cantor set Problem 10.61, proposed by Mendès France [MF67, Problème 1, p. 41]. For a Pisot number $\alpha > 2$ put $$C(\alpha) = \left\{ (\alpha - 1) \sum_{k \ge 1} \varepsilon_k \alpha^{-k} : \varepsilon_k \in \{0, 1\} \right\}.$$ The problem asks to prove that $(\xi \alpha^n)_{n \ge 1}$ is not uniformly distributed modulo one for any $\xi \in C(\alpha)$. In the language of [MF67] this reads $C(\alpha) \cap B(\alpha) = \emptyset$, where $B(\alpha)$ is the set of ξ for which $(\xi \alpha^n)$ is uniformly distributed modulo one. The problem is open. It is easy for an integer base and settled for two quadratic α; the general Pisot case is what remains. [Ste26] reduces it to a statement about shift-invariant measures of the full two-shift, and proves that every true instance admits a finite certificate, so the difficulty is uniformity in α rather than any single α. The variants below state the criterion and the instances of [Ste26] that concern Problem 10.61 directly; the reduction itself is not stated here, since it needs the symbolic model. Deleting the term $n = 0$ does not change uniform distribution modulo one, so the statements indexed from $n = 1$ agree with the ones of [Ste26], which are indexed from $n = 0$. Where an orbit is confined away from an interval the stronger form, for every $n \ge 0$, is stated. *References:* - [Bug12] Bugeaud, Yann. "Distribution modulo one and Diophantine approximation." research solved | proof annotation: False | 官方代码 | 原文线索

It is not true that for every transcendental number `x` the sequence `x * (3 / 2) ^ n` is equidistributed modulo `1`. The sequence `(3 / 2) ^ n` is lacunary, so by the theorem of Pollington [Pol79] and de Mathan [Mat80] the set of real numbers `x` for which `x * (3 / 2) ^ n` is not even dense modulo `1` has Hausdorff dimension `1`. This set is uncountable, so it contains transcendental numbers. Alternatively, an elementary nested-interval construction (see issue #5003) gives a Cantor set of `x` with `Int.fract (x * (3 / 2) ^ (8 * j)) ∈ [0, 1 / 10]` for all `j`, which already rules out equidistribution for uncountably many, hence some transcendental, `x`. By Koksma's metric theorem (Kuipers-Niederreiter, Chapter 1, Section 4), the sequence `x * (3 / 2) ^ n` is equidistributed modulo `1` for almost all `x`.

```
theorem isEquidistributedModuloOne_transcendental_three_halves_pow :

Problem: For every monotone increasing family F, given an interval $[s,t]$ of real numbers so that $t/s > 1000 \log n$ we have some p in the interval $[s,t]$ so that F is optimal with respect to μ_p. This was a "missing lemma" in the work of Kahn and Kalai on threshold behavior of monotone properties. The related [Kahn-Kalai conjecture](https://arxiv.org/abs/math/0603218) was [settled by Park and Pham](https://arxiv.org/abs/2203.17207). **This conjecture is false** without the additional assumption $\mu_t(F) = 1/2$. A counterexample was found by Shlomo Perles (April 7, 2026).

```

MODULE CONTEXT: # Mathoverflow 507128 *Reference:* [mathoverflow/507128](https://mathoverflow.net/questions/507128/embeddability-order-on-picard-groups) asked by user [*Junyan Xu*](https://mathoverflow.net/users/3332/junyan-xu)

V2-000043 | Mathoverflow 507128 | exists_isFractionRing_self_ideal_ne_top_invertible

research solved | proof annotation: True | 官方代码 | 原文线索

There exists a proper ideal `I` in a (commutative) total ring `R` of fractions that is an invertible module. If `I ⊊ R` is such an example, `I` must have infinite order in the Picard group. Moreover, `R` must not be Noetherian (otherwise it must be semi-local and therefore have trivial Picard group). The linked formal proof gives the following explicit construction. Let `D = ℂ[X, Y] / (Y² - X³)` be the coordinate ring of the cuspidal cubic. Let `P = (X - 1, Y - 1)`, which is an invertible ideal. Let `M` be the direct sum of the evaluation fibres at cusp parameters `r ≠ 1`. Form the idealization `R = D ⋉ M`. The desired ideal is the range of the multiplication map `R ⊗[D] P → R`.

```

Conjectures associated with A102371

MODULE CONTEXT: # Conjectures associated with A102371 The sequence $a(n)$ is defined by the recurrence relation $a(1)=1$, and for $n>1$, $a(n) = a(n-1) \operatorname{XOR} (a(n-1) + n)$. The conjecture asks if $a(n) = 2^n - 1 - \operatorname{A105033}(n-1)$ for $n \ge 1$. *References:* - [A102371](https://oeis.org/A102371)

V2-000058 | Conjectures associated with A102371 | conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

Do we have $a(n) = 2^n - 1 - \operatorname{A105033}(n-1)$ for $n \ge 1$? Note: The OEIS comment suggests $n-1$ which means this applies at least for $n \ge 1$, as we assume $\operatorname{A105033}(\mathbb{N})$ is defined on $\mathbb{N}$. We include the case $n=1$ which relies on $A105033(0)$, which is 0.

Smallest power with base>1 and exponent n without digit 0

MODULE CONTEXT: # Smallest power with base>1 and exponent n without digit 0 For statistical reasons it is conjectured that the sequence is finite. Also it is conjectured that $a(40)$ does not exist (i.e. the sequence is empty for $n=40$). *References:* - [A103662](https://oeis.org/A103662)

V2-000064 | Smallest power with base>1 and exponent n without digit 0 | conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

For statistical reasons it is conjectured that the sequence is finite. Finite means here that for some n, no power b^n with base $b > 1$ has a zeroless decimal representation, which in our definition results in $a(n) = 0$. This holds for $n = 2500$ ([source](https://tadamcz.com/fc-review-results/aea251bb26/#/f/OEIS/103662)). Take any integer $b > 1$ and let $N = b^{2500}$. Since $b \ge 2$, we have $N \ge 2^{2500} > 10^5$, so N has at least six decimal digits. We split into four cases depending on the divisibility of b by 2 and 5: - **If $10 \mid b$:** Then $10 \mid N$, so the units digit of N is 0. - **If b is odd and $5 \nmid b$:** Since b is odd and the Carmichael function satisfies $\lambda(16) = 4 \mid 2500$, we have $N \equiv 1 \pmod{16}$. Since $5 \nmid b$ and $\varphi(5^5) = 2500$, Euler's totient theorem gives $N \equiv 1 \pmod{3125}$. By the Chinese Remainder Theorem, $N \equiv 1 \pmod{50000}$ (as $16 \cdot 3125 = 50000$), so the tens digit of N is 0. - **If b is odd and $5 \mid b$:** As above, $N \equiv 1 \pmod{16}$. Since $5 \mid b$ and $2500 \ge 4$, we also have $5^4 = 625 \mid N$, so $N \equiv 0 \pmod{625}$. Since $16 \cdot 625 = 10^4$ and $625 \equiv 1 \pmod{16}$, the Chinese Remainder Theorem gives $N \equiv 625 \pmod{10^4}$. Because $N > 10^4$, the last four digits of N are 0625, so its thousands digit is 0. - **If b is even and $5 \nmid b$:** Since $2 \mid b$ and $2500 \ge 5$, we have $2^5 = 32 \mid N$, so $N \equiv 0 \pmod{32}$. Since $5 \nmid b$, Euler's theorem again gives $N \equiv 1 \pmod{3125}$. Because $32 \cdot 3125 = 10^5$ and $9376 = 293 \cdot 32 = 3 \cdot 3125 + 1$, the Chinese Remainder Theorem gives $N \equiv 9376 \pmod{10^5}$. Since $N > 10^5$, the last five digits of N are 09376, so its ten-thousands digit is 0. In every case, the decimal representation of N contains the digit 0, so $a(2500) = 0$.

research solved | proof annotation: True | 官方代码 | 原文线索

The recurrence given below can be rewritten in the form $$(2n+1)(2n+2)P(2,n)a(n+1) - (2n-1)(2n-2)P(2,-n)a(n-1) = Q(2,n^2)a(n),$$ where the polynomial $Q(2,n) = 4(55n^2 - 34n + 3)$ and the polynomial $P(2,n) = 5n^2 - 5n + 1$ satisfies the symmetry condition $P(2,n) = P(2,1-n)$ and has real zeros. More generally, for fixed $m = 1,2,3, \ldots$, we conjecture that the sequence $b(n) := a(mn)$ satisfies a recurrence of the form $$(\prod_{k = 1}^{2m} (2mn + k))P(2m,n)b(n+1) + (-1)^m(\prod_{k = 1}^{2*m} (2mn - k)) P(2m,-n)b(n-1) = Q(2m,n^2)b(n),$$ where the polynomials $P(2m,n)$ and $Q(2m,n)$ have degree $2m$. Conjecturally, the polynomial $P(2m,n) = P(2m,1-n)$ and has real zeros in the interval [0, 1]. The $4m$ zeros of the polynomial $Q(2m,n^2)$ seem to belong to the interval $[-1, 1]$ and $4m - 2$ of these zeros appear to be approximated by the rational numbers $\pm k/(3m)$, where $1 \le k \le 3m - 2$, k not a multiple of 3.

Numerator of $\binom{6n-2}{2n} / \left(2 \binom{4n-1}{2n}\right)$

MODULE CONTEXT: # Numerator of $\binom{6n-2}{2n} / \left(2 \binom{4n-1}{2n}\right)$ The sequence $a(n)$ is the numerator of $\binom{6n-2}{2n} / \left(2 \binom{4n-1}{2n}\right)$. The OEIS entry records the conjecture that this ratio equals $\text{A005156}(n) / \text{A005156}(n-1)$, where $\text{A005156}(n)$ is the number of $(2n+1) \times (2n+1)$ vertically symmetric alternating sign matrices (VSASMs). This follows from Robbins's VSASM product formula, proved by Kuperberg (2002). *References:* - [A109074](https://oeis.org/A109074) - [A005156](https://oeis.org/A005156) - G. Kuperberg, "Symmetry classes of alternating-sign matrices under one roof," [arXiv:math/0008184](https://arxiv.org/abs/math/0008184), *Ann. of Math.* **156** (2002), 835-866.

V2-000084 | Numerator of $\binom{6n-2}{2n} / \left(2 \binom{4n-1}{2n}\right)$ | conjecture

research solved | proof annotation: False | 官方代码 | 原文线索

"It is conjectured that $\binom{6n-2}{2n} / \left(2 \binom{4n-1}{2n}\right) = \text{A005156}(n+1)/\text{A005156}(n)$." The OEIS comment indexes A005156 from 1; for the 0-indexed sequence `b` this states `frac (n + 1) = b (n + 1) / b n`. This holds by the product formula $$\text{A005156}(n) = \frac{1}{2^n} \prod_{k=1}^{n} \frac{(6k-2)!\,(2k-1)!}{(4k-1)!\,(4k-2)!}$$ conjectured by Robbins and proved by Kuperberg (2002).

V2-000095 | Number of refactorable numbers (A033950) $\le 10^n$ | colton_conjecture

research open | proof annotation: False | 官方代码 | 原文线索

Colton's conjecture [Co99] as stated by Zelinsky [Ze02]: for every n, the number of refactorable numbers $\le n$ is at least half the number of primes $\le n$, i.e. $\pi(n) \le 2\,T(n)$. Zelinsky [Ze02] proved this for all sufficiently large n (see `conjecture`), with an explicit bound of $7.42 \cdot 10^{13}$ beyond which it holds; the remaining range is open.

```
theorem colton_conjecture : ∀ n : ℕ, Nat.primeCounting n ≤ 2 * countRefactorableNat n
```

V2-000096 | Number of refactorable numbers (A033950) $\le 10^n$ | conjecture

research solved | proof annotation: False | 官方代码 | 原文线索

Simon Colton conjectures that the number of refactorable numbers less than x is at least $\frac{x}{2\log x}$. This is an asymptotic claim, so we state it for sufficiently large x. In this form it is a theorem: Zelinsky [Ze02, Theorem 7] proved that for every k the number of refactorable numbers $\le n$ exceeds $k \pi(n)$ for all sufficiently large n, and $\pi(n) \sim n / \log n$. It also follows from Spiro's asymptotic [Sp85], by which the count is $\frac{x}{\sqrt{\log x}} (\log \log x)^{-1 + o(1)}$. See `colton_conjecture` for the pointwise conjecture that remains open.

The first prime terms in this (always odd) sequence are $a(1) = 3$, $a(3) = 41$, and $a(4) = 593$. What is the next prime? The OEIS comment currently says `$a(5) = 543$`, but this conflicts with its defining formula, b-file, and examples: the actual index-five term is the composite number `135457`. Consequently the search for the next prime must begin after index `4`, not after index `5`.

```
theorem conjecture1 :
conjecture1.answer = a (sInf {n : ℕ | 4 < n ∧ (a n).Prime})
```

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture based on OEIS A114831: What is this sequence, asymptotically? If the limit exists, the ratio of consecutive terms must tend to $\sqrt{3}$: $$ \lim_{n \to \infty} \frac{a(n+1)}{a(n)} = \sqrt{3}. $$ That's because $a(n)$ is positive, monotonically increasing ($a(n) > a(n-1)$) and $a(n+2) \geq a(n+1) + a(n)$. So $a(n)$ grows exponentially, at least as fast as the Fibonnaci numbers. Assuming $\frac{a(n+1)}{a(n)}$ tend to a limit L, solving for L in the definition of $a(n)$ gives $L=\sqrt{3}$.

V2-000135 | Ratio of product of GCDs to product of factorials of floor divisions | conjecture1

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture (1): $a(n)$ is always an integer (the denominator divides the numerator). Proof summary: Let $c(n) = \prod_{j=1}^n \prod_{k=1}^n (j,k)$ be the numerator. Observe that $$\textrm{ord}(c(n), p) = \left\lfloor \frac{n}{p} \right\rfloor^2 + \left\lfloor \frac{n}{p^2} \right\rfloor^2 + ...$$ proven similar to Legendre's formula for $\textrm{ord}(n!, p)$. Next let $d(n) = \prod_{k=1}^n (\lfloor n/k \rfloor!)^k$ be the denominator. Observe that $$\textrm{ord}(d(n), p) = \sum_{k=1}^n k\,\textrm{ord}(\lfloor n/k \rfloor, p) = \sum_{k=1}^n \sum_{r \geq 1} k \left\lfloor \frac{\lfloor n/p^r \rfloor}{k} \right\rfloor.$$ Combining the two gives: $$\textrm{ord}(a(n), p) = \sum_{r \geq 1} \sum_{k=1}^n \left(\left\lfloor \frac{n}{p^r} \right\rfloor \textrm{mod } k\right).$$ Defining $b(m) = \sum_{k=1}^m m \textrm{ mod } k$, we obtain $\textrm{ord}(a(n), p) = \sum_{r \geq 1} b(\lfloor n/p^r \rfloor)$. As $b(m) \geq 0$, $\textrm{ord}(a(n), p)$ is non-negative for any p, so $a(n)$ is an integer.

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture (2): If p is a prime, then $p \mid a(n)$ if and only if $p \le n/3$. Proof summary: We use the formula shown above: $\textrm{ord}(a(n), p) = \sum_{r \geq 1} b(\lfloor n/p^r \rfloor)$ where $b(m) = \sum_{k=1}^m m \textrm{ mod } k$. If $p \mid a(n)$ then $b(\lfloor n/p^r \rfloor) ≥ 1$ for some $r ≥ 1$. Since b(m) = 0$ for $m \leq 2$, we must have $n / p^r \geq 3$. If the inequality holds for $r \geq 1$, it must be true for $r = 1$. Hence $n \geq 3p$, proving the conjecture.

V2-000137 | Ratio of product of GCDs to product of factorials of floor divisions | conjecture3

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture (3): For each positive integer n, prime p, and $0 \le k < p$, $\mathrm{ord}_p(a(np)) = \mathrm{ord}_p(a(np + k))$. Proof summary: This follows from the formula shown above: $\textrm{ord}(a(n), p) = \sum_{r \geq 1} b(\lfloor n/p^r \rfloor)$ where $b(m) = \sum_{k=1}^m m \textrm{ mod } k$. Since $k < p$, we have $\lfloor (np + k)/p^r \rfloor = \lfloor np/p^r \rfloor$ for every $r \geq 1$, proving the claim.

```
theorem conjecture3 (n p k : ℕ) (hn : 0 < n) (hp : p.Prime) (hk : k < p) :

V2-000162 | Smallest index $k > n$ such that $(p_k+p_{k+1})/(p_n+p_{n+1})$ is an integer ≥ 2 | conjecture2

research open | proof annotation: False | 官方代码 | 原文线索

Open problem: is the ratio $f(n, k)$ bounded, where $k = a(n)$? No hypothesis on the existence of $a(n)$ is needed: if no suitable $k > n$ exists then $a(n) = 0$ and $S(0) / S(n) = 4 / S(n) = 0$ for $n > 0$, so such n do not affect boundedness. When $a(n) \neq 0$ we have $S(n) \mid S(a(n))$ by definition, so the division is exact.

The coefficients $c(n)$ of $A(x)^2 = (\sum_{n \ge 0} a(n) x^n)^2$ differ in sign from $c(n-1)$ if and only if n is a triangular number. - _Peter Bala_, Mar 17 2022 **Proof sketch** (the kernel-checked development lives at the `formal_proof` permalink below). Write $a(n)/n! = \sum_j (-1)^j L_j(n)$, where $L_j(n)$ is the sum of $\prod_{s \in S} 1/s!$ over all sets S of j distinct positive integers with sum n. A "down map" (lowering by one the least element of S above its first gap) gives $L_{k-1}(n) \le \frac{91}{100} L_k(n)$ for all $k \ge 1$ and $n \ge k(k+1)/2$. Hence the top nonzero layer $L_m(n)$ dominates, where $m(m+1)/2 \le n < (m+1)(m+2)/2$; this reproves `conjecture1` and gives $|a(n)| \ge \frac{9}{100} n! L_m(n)$. Since $c(n) = 2a(n) + \sum_{0<k<n} a(k)a(n-k)$, the sign of $c(n)$ equals that of $a(n)$ whenever $\sum_{0<k<n} |a(k)a(n-k)| < 2|a(n)|$. For $n \le 2500$, conjecture 2 is checked in the kernel from a certified table of $a(n)$; for $n > 2500$, explicit estimates (rational arithmetic and elementary bounds only) bound the cross sum by $0.18 \cdot n! L_m(n)$, which is less than $2|a(n)|$.

Conjecture: "More generally, for r >= 1, we conjecture that there exists a constant D(r) such that D(r)*a(n)/Product_{i = 1..r, i coprime to 30} (30*n - i) is integral for all n." - _Peter Bala_, Aug 28 2025 This generalizes `thirty_mul_sub_one_dvd_a` (the $r = 1$ case where $D(1) = 1$). **Proof sketch** (kernel-checked development at the `formal_proof` permalink below, which proves the non-vacuous form with the explicit positive witness $D = (r!)^{r^2}$): Legendre-valuation analysis of the Landau step function $\Delta(x) = \lfloor 30x \rfloor + \lfloor x \rfloor - \lfloor 15x \rfloor - \lfloor 10x \rfloor - \lfloor 6x \rfloor$, whose values lie in $\{0, 1\}$. Three ingredients: a unit-class rigidity lemma ($\Delta_c = 1$ for every unit class c modulo 30), a witness-uniqueness bound for prime powers $p^k > r$ (at most one factor of the divisor product is divisible by p^k), and a uniform low-layer budget for $p^k \le r$ absorbed by the witness constant.

theorem general_divisibility (r : ℕ) (hr : 1 ≤ r) :

Existence of integers k with $k^2 \operatorname{XOR} (k+1)^2 = (2n+1)^2$

MODULE CONTEXT: # Existence of integers k with $k^2 \operatorname{XOR} (k+1)^2 = (2n+1)^2$ a: $a(n) = \text{least } k \text{ such that } \sqrt{k^2 \operatorname{XOR} (k+1)^2} = 2n+1$, $a(n) = -1 \text{ if there is no such } k$. This is equivalent to finding the smallest $k \in \mathbb{N}$ such that $k^2 \oplus (k+1)^2 = (2n+1)^2$. We use the set infimum (sInf) to denote the least element of the set of natural numbers satisfying the condition. Since Mathlib's `sInf` on a subset of `ℕ` gives a result in `ℕ`, this definition is only completely faithful to the OEIS when the set is non-empty. The OEIS definition implies that the set of k's is non-empty for all n. *References:* - [A224515](https://oeis.org/A224515) - [arxiv/2605.22763](https://arxiv.org/abs/2605.22763) *Advancing Mathematics Research with AI-Driven Formal Proof Search* by George Tsoukalas et al.

If p is an odd prime then $a((p^3-1)/2) = p \cdot a((p^2-1)/2)$. Because otherwise $a((p^3-1)/2) < p \cdot a((p^2-1)/2)$ iff $a((p^3-1)/2) = a((p-1)/2)$ for a prime p. Equivalently p^3 divides $2^{p-1}-1$, but no such prime p is known. - Thomas Ordowski, Feb 10 2014

```
theorem conjecture1 (p : ℕ) (hp : p.Prime) (hp_odd : p ≠ 2) :
a ((p ^ 3 - 1) / 2) = p * a ((p ^ 2 - 1) / 2)
```

FC-OeisA2326.conjecture1

V2-000208 | Multiplicative order of 2 mod $2n+1$ | conjecture2

research open | proof annotation: False | 官方代码 | 原文线索

A generalization of the previous conjecture: For each $k \ge 2$, if p is an odd prime then $a((p^{k+1}-1)/2) = p \cdot a((p^k-1)/2)$. Computer testing of this generalized conjecture shows that there is no counterexample for k and p both up to 1000. - [Ahmad J. Masad](https://oeis.org/wiki/User:Ahmad_J._Masad), Oct 17 2020 The two are in fact equivalent. Its $k = 2$ instance is `conjecture1`. Conversely, write $d = \operatorname{ord}_{p^2}(2)$. `conjecture1` for p says $v_p(2^d - 1) = 2$, and lifting the exponent for the odd prime p then gives $v_p(2^{d p^t} - 1) = 2 + t$, hence $\operatorname{ord}_{p^{2+t}}(2) = d p^t$ for every $t \ge 0$, which is every instance for that p.

```
theorem conjecture2 (k : ℕ) (hk : 2 ≤ k) (p : ℕ) (hp : p.Prime) (hp_odd : p ≠ 2) :
a ((p ^ (k + 1) - 1) / 2) = p * a ((p ^ k - 1) / 2)
```

Observation: "a(A002997(n)) >= 3, at least for 1 <= n <= 10000." - _Omar E. Pol_, Oct 21 2025 That is, $a(k) \ge 3$ for every Carmichael number k. A002997 is the sequence of Carmichael numbers: the composite numbers k such that $b^{k-1} \equiv 1 \pmod k$ for every b coprime to k. This is `IsCarmichael`, which also forces k to be composite. The observation holds for every odd composite k, so in particular for every Carmichael number. Write p for the least prime factor of k and $q = k/p$. The two smallest divisors of k are 1 and p, and the two largest are q and k, so $(1, p)$ and (q, k) are both consecutive pairs in the sorted divisor list, and they are distinct because $1 < q$. Both qualify: p and k are odd, $p \ge 2 \cdot 1$, and $k = pq \ge 3q > 2q$. Hence the count is at least 2 and $a(k) \ge 3$. A Carmichael number is odd: it is composite by the $b = 1$ case of `IsCarmichael`, so $k > 2$, and if k were even then the coprime base $k - 1 \equiv -1$ would give $k \mid (-1)^{k-1} - 1 = -2$.

Zhi-Wei Sun's Conjecture (A287616): Any nonnegative integer can be written as the sum of a triangular number $x(x+1)/2$, a generalized pentagonal number $y(3y+1)/2$, and a generalized heptagonal number $z(5z+1)/2$, where x, y, z are nonnegative integers. This was proved in [CGQFG26].

Zhi-Wei Sun's Conjecture (A303639): any integer $n > 1$ can be written as $a^2 + b^2 + \binom{2c+1}{c} + \binom{2d+1}{d}$ with a, b, c, d nonnegative integers. Sun checked this for n up to $6 \cdot 10^8$. This is false: $n = 800322180$ admits no such representation, so $a(800322180) = 0$. Since $\binom{33}{16} > 800322180$, only $c, d \le 15$ are possible, and each of the resulting 136 remainders $800322180 - \binom{2c+1}{c} - \binom{2d+1}{d}$ is divisible by some prime $p \equiv 3 \pmod 4$ to an odd power, hence is not a sum of two squares by Fermat's two-square theorem. The counterexample is recorded as an approved comment on the OEIS entry; the Lean proof linked below formalises this argument, and was produced by Claude Opus 5 prompted by Sunsu Jeong ([DCLXAI](https://github.com/DCLXAI)).

Nonnegativity of the Dirichlet square root of A046644

MODULE CONTEXT: # Nonnegativity of the Dirichlet square root of A046644 A317940 is the integer sequence whose value `a n` is the numerator of the rational sequence `f n`, where the Dirichlet convolution square of `f` is A046644. The auxiliary sequence A046644 is multiplicative and takes the value $2^{\operatorname{A005187}(e)}$ on a prime power p^e. The conjecture asks whether `f n` is nonnegative for every positive `n`. The proof reduces the problem to prime powers and constructs positive rational coefficients $c(e)$ satisfying $$\sum_{i=0}^e c(i)c(e-i)=2^{\operatorname{A005187}(e)}.$$ The coefficients are obtained from formal power series. A positive series A is defined by the first-order differential equation $A' = \frac12 D A$. A second explicitly defined series B satisfies $B' = D B$ and has the same constant term as A^2; uniqueness of the coefficient recurrence therefore gives $A^2=B$. After rescaling the coefficients by 4^e, this becomes the displayed prime-power convolution identity. Extending $c(e)$ multiplicatively over prime factorizations gives a positive arithmetic function `root` with `root * root = a046644`. Finally, the recursive definition of `f` is shown to be the unique Dirichlet square root with value one at 1, so `f = root` and every positive-index value of `f` is positive. This route was found by first exploiting the multiplicativity recorded in the OEIS entry, reducing the recurrence to the exponent of a single prime, and then recognizing the resulting coefficient identities as a formal-power-series differential equation. *References:* - [A317940](https://oeis.org/A317940) - [A046644](https://oeis.org/A046644) - [A005187](https://oeis.org/A005187)

V2-000248 | Nonnegativity of the Dirichlet square root of A046644 | f_nonnegative

research solved | proof annotation: True | 官方代码 | 原文线索

"No negative terms among the first 2^20 terms. Is the sequence nonnegative?" Equivalently, the rational Dirichlet square root `f` is nonnegative at every positive index. Informally, the proof constructs a strictly positive multiplicative square root prime-power by prime-power using formal power series, and then identifies it with the recursively defined sequence `f`. The proof was obtained by exploiting the multiplicativity of A046644 and reducing the problem to its values on prime powers. The resulting convolution recurrence for the prime-power coefficients was recognized as a formal-power-series identity. A positive coefficient sequence was constructed through a differential equation for the generating series, extended multiplicatively to all positive integers, and finally identified with the recursively defined Dirichlet square root by uniqueness.

Conjectures associated with A038552

MODULE CONTEXT: # Conjectures associated with A038552 A038552 lists the largest squarefree number k such that the imaginary quadratic field $\mathbb{Q}(\sqrt{-k})$ has class number n. The conjectures state that: 1. All terms are congruent to $19 \pmod{24}$. 2. This is also the largest absolute value of negative fundamental discriminant d for class number n. 3. For even n, if k is the largest odd number with $h(-k) = n$ and k' is the largest even number with $h(-k') = n$, then $k > k'$. Here $h(D)$ is the class number of the quadratic field with discriminant D, so k and k' are absolute values of negative fundamental discriminants, not radicands. The source states conjecture 2 in this form. The squarefree condition in the definition is needed for the maximum to exist, since $\mathbb{Q}(\sqrt{-k}) = \mathbb{Q}(\sqrt{-4k})$. Conjecture 2 is not a restatement of the definition. Both maxima range over the same imaginary quadratic fields, but they maximize different integers attached to those fields. A038552 uses the squarefree radicand k, whereas the discriminant of $\mathbb{Q}(\sqrt{-k})$ is $-k$ for $k \equiv 3 \pmod 4$ and $-4k$ otherwise. The map $k \mapsto |d|$ is not monotone: it sends 2 to 8 and 3 to 3. So conjecture 2 says that the largest term k satisfies $k \equiv 3 \pmod 4$, and that $4k' \le k$ for every $k' \equiv 1, 2 \pmod 4$ with class number n. *References:* - [Sta67] Stark, Harold M. Are there composite numbers $n > 4$ such that $n \equiv a(n) \pmod{\phi(n)}$? - Thomas Ordowski, Dec 02 2019 This question is equivalent to Lehmer's totient problem `LehmerTotient.lehmer_totient`; a positive answer here falsifies the universal statement asked about in `Erdos828.erdos_828.variants.lehmer_conjecture`. Any composite n with $\phi(n) \mid n - 1$ is squarefree, so $a(n) = 1$ and the condition here holds. Conversely, let $n > 4$ be composite with $\phi(n) \mid n - a(n)$ and $e = a(n) \ge 2$, and pick p with $p^e \mid n$. Then $p^{e-1} \mid \phi(n) \mid n - e$ and $p^{e-1} \mid n$, so $p^{e-1} \mid e$, which forces $p = 2$ and $e = 2$. Now $n = 4m$ with m odd and squarefree, and $2\phi(m) \mid 4m - 2$ makes $\phi(m)$ odd, so $m = 1$ and $n = 4$. Hence $e = 1$ and the condition is $\phi(n) \mid n - 1$.

theorem conjecture1 :
∃ n : ℕ, 4 < n ∧ ¬ n.Prime ∧ n.totient | (n - a n)

FC-OeisA51903.conjecture1

V2-000302 | Maximum exponent in the prime factorization of n | conjecture2

research solved | proof annotation: True | 官方代码 | 原文线索

Are there odd numbers n such that $a(n) > 1$ and $n \equiv a(n) \pmod{\lambda(n)}$? (Equivalently, odd numbers n such that $a(n) > 1$ and $b^n \equiv b^{a(n)} \pmod n$ for all b.) - Thomas Ordowski, Dec 02 2019 The answer is no. Let $q^E \| n$ with $E = a(n) \ge 2$ and take $b = q + 1$: then $(q+1)^{n-E} \equiv 1 \pmod{q^E}$, so lifting the exponent gives $q^{E-1} \mid n - E$. Since also $q^{E-1} \mid n$, we get $q^{E-1} \mid E$, which is impossible for $q \ge 3$.

theorem conjecture2 :
∃ n : ℕ, Odd n ∧ 1 < a n ∧ ∀ b : ℕ, b ^ n ≡ b ^ (a n) [MOD n]

Are there odd numbers n such that $a(n) > 1$ and $n \equiv a(n) \pmod{\operatorname{ord}_n(2)}$? (Equivalently, odd numbers n such that $a(n) > 1$ and $2^n \equiv 2^{a(n)} \pmod n$.) - Thomas Ordowski, Dec 02 2019 The answer is yes: $n = 7 \cdot 631 \cdot 881 \cdot 3511^2 \cdot 201961 = 96879631678643449 37$ is odd, $a(n) = 2$ and $2^n \equiv 2^2 \pmod n$. A square factor $q^2 \mid n$ forces q to be a Wieferich prime; 3511 works because $\operatorname{ord}_{3511^2}(2) = 1755$ is odd and $n \equiv 2 \pmod{1755}$.

Subword complexity of the morphism a → aab, b → b

MODULE CONTEXT: # Subword complexity of the morphism a → aab, b → b Let a_n be the number of distinct subwords (contiguous factors) of length n in the infinite word generated by the morphism $\sigma: a \mapsto aab, b \mapsto b$, starting from a. As shown in the references, a_n is given by the formula $$ a_n = \sum_{i=0}^{n} \min(2^i,n-i+1). $$ The conjectured generating function is: $$\sum_{n \geq 0} a_n x^n = \frac{1}{1-x} + \frac{x}{(1-x)^2}\left(\frac{1}{1-x} - \sum_{k \geq 1} x^{2^k + k - 1}\right).$$ *References:* - [A6697](https://oeis.org/A6697) - J.-P. Allouche and J. Shallit, "On the subword complexity of the fixed point of a → aab, b → b, and generalizations," arXiv:1605.02361 [math.CO], 2016. - N. J. A. Sloane and Simon Plouffe, *The Encyclopedia of Integer Sequences*, Academic Press, 1995.

V2-000321 | Subword complexity of the morphism a → aab, b → b | conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture (A6697): The generating function for the number of subwords of length n in the infinite word generated by $a \mapsto aab, b \mapsto b$ is $$\sum_{n \geq 0} a_n x^n = 1 + \frac{1}{1-x} + \frac{1}{(1-x)^2}\left(\frac{1}{1-x} - \sum_{k \geq 0} x^{2^{k+1} + k}\right).$$ Equivalently, a(n) equals the n-th coefficient of this generating function. However, the reference quoted in the OEIS sequence > J.-P. Allouche and J. Shallit, "On the subword complexity of the fixed point of a → aab, b → b, > and generalizations," arXiv:1605.02361 [math.CO], 2016. provides an explicit formula $$ a_n = \sum_{i=0}^{n} \min(2^i,n-i+1). $$ If one takes this as a definition of a(n) instead, it becomes straightforward to prove the conjecture. See https://github.com/AxiomMath/gdm-formal-conjectures/blob/main/docs/OeisA6697.md for a formal proof of the generating function using this definition. Hence, a formalization of [arXiv:1605.02361](https://arxiv.org/abs/1605.02361) would complete a formal proof as below.

theorem conjecture (n : ℕ) :
a n = coeff (R := ℚ) n
((1 - X)⁻¹ + X * (1 - X)⁻¹ ^ 2 * ((1 - X)⁻¹ - ∑' k, X ^ (2 ^ (k + 1) + k)))

Conjecture relating two characterizations of a set of integers.

MODULE CONTEXT: # Conjecture relating two characterizations of a set of integers. Informal Statement: For an integer $k \ge 2$, the following are equivalent: 1. The greatest common divisor of the binomial coefficients $\binom{2k}{k}, \binom{3k}{k}, \dots, \binom{(k+1)k}{k} = 1$. 2. Writing prime factorization of k as $k = \prod p_i^{e_i}$, and let $P = \max_i p_i^{e_i}$, one has $k / P > P$. This conjecture asserts that the sequence defined by 1. is obtained by taking 1 off each number in the sequence defined by 2. *References:* - [A80170](https://oeis.org/A80170) - [A51283](https://oeis.org/A51283)

Open Quantum Problem 23: SIC-POVMs

MODULE CONTEXT: # Open Quantum Problem 23: SIC-POVMs ## Mathematical problem The OQP page presents three increasingly strong formulations of this problem. In this file we formalize the first one, closest to the physics terminology: existence of a symmetric informationally complete POVM in every finite dimension. A SIC-POVM in dimension d can be represented by a family of d^2 normalized vectors in $\mathbb{C}^d$ whose pairwise squared overlaps are all equal to $(d + 1)^{-1}$. We encode such a family as a map `Fin (d ^ 2) → StateVector d`. ## Background SIC-POVMs are a basic structure in finite-dimensional quantum information. They are closely related to equiangular lines, tight frames, quantum state reconstruction, and finite-dimensional measurement theory. The open problem asks whether such families exist in every dimension. ## What this file formalizes This file formalizes the existence problem for symmetric informationally complete POVMs through the predicate `HasSICPOVM d`. More precisely, it contains the following layers. ### Core API The main definitions formalized in this file are: - `StateVector d`: a state vector in `ℂ^d`; - `mkStateVector`: constructor from coordinates in the computational basis; - `IsNormalized ψ`: normalization predicate for a state vector; - `overlapSq φ ψ`: squared magnitude of the inner-product overlap; - `HasConstantOverlapSq c Φ`: constant pairwise squared-overlap condition; - `sicOverlapSq d`: the SIC overlap value `(d + 1)⁻¹`; - `IsSICFamily d Φ`: the predicate that a family of `d^2` vectors in `ℂ^d` is a SIC family; - `HasSICPOVM d`: existence of a SIC family in dimension `d`. In addition, the file includes explicit witness families and convenient constructors used in the low-dimensional benchmark cases: - `vec2`, `vec3`; - `qubitSICFamily`; - `hesseFamily`; - `bb84Family`. ### Complete open conjecture The main open theorem is: - `sicPOVMs`, expressing the conjecture that for every `d ≥ 1`, there exists a SIC-POVM in dimension `d`. ### Special cases The file also isolates several special cases: - solved low-dimensional benchmark cases: `hasSICPOVM_zero`, `hasSICPOVM_one`, `hasSICPOVM_two`, `hasSICPOVM_three`; - a negative benchmark result: `bb84Family_not_isSICFamily`, showing that the BB84 family in dimension `2` does not form a SIC family; - selected open benchmark dimensions: `hasSICPOVM_56`, `hasSICPOVM_58`, `hasSICPOVM_59`, `hasSICPOVM_60`, `hasSICPOVM_64`, `hasSICPOVM_68`, `hasSICPOVM_69`, `hasSICPOVM_70`, `hasSICPOVM_71`, `hasSICPOVM_72`, `hasSICPOVM_75`. ### Test lemmas The file includes the following test lemmas and benchmark-support statements: - `hasConstantOverlapSq_singleton`; - `sicOverlapSq_one`, `sicOverlapSq_two`, `sicOverlapSq_three`, `sicOverlapSq_pos`; - `isSICFamily_singleton_iff`, `isSICFamily_one_of_normalized`; - `qubitSICFamily_normalized`, `qubitSICFamily_pairwise`; - `hesseFamily_normalized`, `hesseFamily_pairwise`; - `bb84Family_normalized`. At present, these `@[category test, AMS 15 47 81]` results are included with placeholder proofs `by sorry`; they are intended to be proved in the next PR. ## References *Primary source list entry:* - IQOQI Vienna Open Quantum Problems, problem 23: https://oqp.iqoqi.oeaw.ac.at/sic-povms-and-zauners-conjecture - Formal Conjectures issue #1823: https://github.com/google-deepmind/formal-conjectures/issues/1823 ### Foundational references - J. Open Quantum Problem 35: existence of absolutely maximally entangled pure states

MODULE CONTEXT: # Open Quantum Problem 35: existence of absolutely maximally entangled pure states **Problem:** For which numbers of parties n and local dimensions d does there exist a pure absolutely maximally entangled state ψ? A pure state ψ on n parties of local dimension d is called **absolutely maximally entangled (AME)** if, for every subset of at most half of the parties, the corresponding reduced density matrix is maximally mixed. *References:* - Open Quantum Problems, Problem 35: <https://oqp.iqoqi.oeaw.ac.at/existence-of-absolutely-maximally-entangled-pure-states> - Formal Conjectures issue #3452: <https://github.com/google-deepmind/formal-conjectures/issues/3452> - W. Grassl, *Quantum Codes of Maximal Distance and Highly Entangled Subspaces*, Quantum 4, 284 (2020), arXiv:1907.07733. - S. A. Rather, A. Burchardt, W. Bruzda, G. Rajchel-Mieldzioć, A. Lakshminarayan, and K. Życzkowski, *Thirty-six entangled officers of Euler: Quantum solution to a classically impossible problem*, Phys. Rev. Lett. 128, 080507 (2022), arXiv:2104.05122. - G. Rajchel-Mieldzioć, R. Bistroń, A. Rico, A. Lakshminarayan, and K. Życzkowski, *Absolutely maximally entangled pure states of multipartite quantum systems*, arXiv:2508.04777 (2025). - S. Bevins and Y. Bidav, *Symmetry-guided constructions of absolutely maximally entangled states in five open cases*, [arXiv:2608.05781](https://arxiv.org/abs/2608.05781) (2026). - F. Shi, X. Zhang, Q. Zhao, and L. Li, *Complete Existence Classification of Seven-Partite Absolutely Maximally Entangled States*, [arXiv:2608.01011](https://arxiv.org/abs/2608.01011) (2026). This file formalizes the problem of determining for which pairs (n,d) there exists an absolutely maximally entangled pure state $\mathrm{AME}(n,d)$. We represent an n-partite state of local dimension d by the finite-dimensional Hilbert space `EuclideanSpace ℂ (Config n d)`, whose coordinates in the computational basis are amplitudes. The helper `mkStateVector` turns an amplitude function into such a state, and normalization is imposed explicitly via `IsNormalized`, i.e. via the ambient L^2 norm. The main reusable lemma is `reducedDensityFirst_of_completion`: if a state is a uniform superposition over the graph of an injective completion function `completion : Config m d → Config (n - m) d`, then the reduced state on the first m parties is maximally mixed. As demonstration, we show that the Bell states with $n=2$ and GHZ states with $n=3$ are AME states, and the GHZ state with $n=4$ is not an AME state.

[Announcement](https://x.com/ElliotGlazer/status/2112179703687856497) - [A2020] Aaronson, S., [*The Busy Beaver Frontier*](https://doi.org/10.1145/3427361.3427369). ACM SIGACT News **51** (2020), 32-54. This file defines the smallest n for which the value of $BB(n)$ is undecidable. More precisely, it formalizes the least number of states for which ZFC can neither prove nor disprove that a specific Turing machine halts. Its existence and known upper bounds follow from Gödel's second incompleteness theorem. We do this by modeling a version of first order logic, ZFC and Turing machines within Lean. The implementation of FOL and ZFC is taken from the [FormalizedLogicLean](https://github.com/FormalizedFormalLogic/Foundation) project. The implementation is copied and minimized from that project. It is not necessary to read it to understand the definition of `C14`. The copied definitions span the section `FormalizedFormalLogic`. Confidence in that implementation partly comes from the large body of proofs developed with it, including formalizations of independence theorems. This is followed by a model of Turing machines within the first-order logic framework, developed for Formal Conjectures in the section `BackgroundDefs`. The file then defines `C14` and states its known bounds and related conjectures. The known bounds use `sorry`; formalizing one would be a substantial achievement.

V2-000419 | Tao's Optimization Constant 14 / Smallest n for which the value of $BB(n)$ is undecidable | c14_ge_4

research solved | proof annotation: False | 官方代码 | 原文线索

Proven by Lin and Radó in [LS1965] by computing $BB(3) = 21$.

theorem c14_ge_4 : 4 ≤ C14

FC-Constant14.c14_ge_4

V2-000420 | Tao's Optimization Constant 14 / Smallest n for which the value of $BB(n)$ is undecidable | c14_ge_5

research solved | proof annotation: False | 官方代码 | 原文线索

An intermediate lower bound, proved by Brady in [B1983] by explicitly computing $BB(4) = 107$.

theorem c14_ge_5 : 5 ≤ C14

Beaver Math Olympiad (BMO)

MODULE CONTEXT: # Beaver Math Olympiad (BMO) The Beaver Math Olympiad (BMO) is a set of mathematical reformulations of the halting/nonhalting problem of specific Turing machines from all-0 tape. These problems came from studying small Busy Beaver values. Some problems are open and have a conjectured answer, some are open and don't have a conjectured answer, and, some are solved. Among these problems is the Collatz-like *Antihydra* problem which is open and coming from a 6-state Turing machine, and a testament to the difficulty of knowing the sixth Busy Beaver value. For some BMO problem, the equivalence between the mathematical formulation and the corresponding Turing machine non-termination has been formally proved in Rocq, we indicate it when done. *References:* - bbchallenge.org - [Beaver Math Olympiad wiki page](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad) - [Antihydra web page](https://bbchallenge.org/antihydra) - [Antihydra wiki page](https://wiki.bbchallenge.org/wiki/Antihydra)

V2-000444 | Beaver Math Olympiad (BMO) | beaver_math_olympiad_problem_1

research open | proof annotation: False | 官方代码 | 原文线索

[BMO#1](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad#1._1RB1RE_1LC0RA_0RD1LB_---1RC_1LF1RE_0LB0LE_(bbch)) Let $(a_n)_{n \ge 1}$ and $(b_n)_{n \ge 1}$ be two sequences such that $(a_1, b_1) = (1, 2)$ and $$(a_{n+1}, b_{n+1}) = \begin{cases} (a_n-b_n, 4b_n+2) & \text{if }a_n \ge b_n \cr (2a_n+1, b_n-a_n) & \text{if }a_n < b_n \end{cases}$$ for all positive integers n. Does there exist a positive integer i such that $a_i = b_i$? The first 10 values of (a_n, b_n) are $(1, 2), (3, 1), (2, 6), (5, 4), (1, 18), (3, 17), (7, 14), (15, 7), (8, 30), (17, 22)$. [BMO#1](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad#1._1RB1RE_1LC0RA_0RD1LB_---1RC_1LF1RE_0LB0LE_(bbch)) is equivalent to asking whether the 6-state Turing machine [`1RB1RE_1LC0RA_0RD1LB_---1RC_1LF1RE_0LB0LE`](https://wiki.bbchallenge.org/wiki/1RB1RE_1LC0RA_0RD1LB_---1RC_1LF1RE_0LB0LE) halts or not. There is presently no consensus on whether the machine halts or not, hence the problem is tagged as a `question`. The machine was discovered by bbchallenge.org contributor Jason Yuen on June 25th 2024.

```

V2-000445 | Beaver Math Olympiad (BMO) | beaver_math_olympiad_problem_2_antihydra

research open | proof annotation: False | 官方代码 | 原文线索

[BMO#2](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad#2._Hydra_and_Antihydra) Antihydra is a sequence starting at 8, and iterating the function $$H(n) = \left\lfloor \frac {3n}2 \right\rfloor.$$ The conjecture states that the cumulative number of odd values in this sequence is never more than twice the cumulative number of even values. It is a relatively new open problem with, so it might be solvable, although seems quite hard because of its Collatz-like flavor. The underlying Collatz-like map has been studied independently in the past, see doi:[10.1017/S0017089508004655](https://doi.org/10.1017/S0017089508004655) (Corollary 4). It is equivalent to non-termination of the [`1RB1RA_0LC1LE_1LD1LC_1LA0LB_1LF1RE_---0RA`](https://wiki.bbchallenge.org/wiki/Antihydra) 6-state Turing machine (from all-0 tape). Note that the conjecture that the machine does not halt is based on [a probabilistic argument](https://wiki.bbchallenge.org/wiki/Antihydra#Trajectory). This machine and its mathematical reformulations were found by bbchallenge.org contributors mxdys and Rachel Hunter on June 28th 2024.

```

[BMO#4](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad#4._1RB3RB---1LB0LA_2LA4RA3LA4RB1LB_(bbch)) Bonnie the beaver was bored, so she tried to construct a sequence of integers $\{a_n\}_{n \ge 0}$. She first defined $a_0=2$, then defined a_{n+1} depending on a_n and n using the following rules: * If $a_n \equiv 0\text{ (mod 3)}$, then $a_{n+1}=\frac{a_n}{3}+2^n+1$. * If $a_n \equiv 2\text{ (mod 3)}$, then $a_{n+1}=\frac{a_n-2}{3}+2^n-1$. With these two rules alone, Bonnie calculates the first few terms in the sequence: $2, 0, 3, 6, 11, 18, 39, 78, 155, 306, \dots$. At this point, Bonnie plans to continue writing terms until a term becomes 1 (mod 3). If Bonnie sticks to her plan, will she ever finish? [BMO#4](https://wiki.bbchallenge.org/wiki/Beaver_Math_Olympiad#4._1RB3RB---1LB0LA_2LA4RA3LA4RB1LB_(bbch)) is equivalent to the non-termination of 2-state 5-symbol Turing machine [`1RB3RB---1LB0LA_2LA4RA3LA4RB1LB`](https://wiki.bbchallenge.org/wiki/1RB3RB---1LB0LA_2LA4RA3LA4RB1LB) (from all-0 tape). The machine was informally proven not to halt bbchallenge.org contributor Daniel Yuan on July 19th 2024; see [sketched proof](https://wiki.bbchallenge.org/wiki/1RB3RB---1LB0LA_2LA4RA3LA4RB1LB) and [Discord discussion](https://discord.com/channels/960643023006490684/960643023530762343/1263666591900631210).

The Gerstenhaber problem for three commuting matrices

MODULE CONTEXT: # The Gerstenhaber problem for three commuting matrices Gerstenhaber proved in 1961 [Ger61] that the unital algebra generated by two commuting $n \times n$ matrices over a field has dimension at most n. It is an open problem, known as the **Gerstenhaber problem**, whether the same bound holds for three pairwise commuting matrices. The bound fails for four or more pairwise commuting matrices. *References:* - [Ger61] M. Gerstenhaber, *On dominance and varieties of commuting matrices*. Annals of Mathematics (2) 73 (1961), no. 2, 324-348. https://doi.org/10.2307/1970336 - [arXiv:2402.16334](https://arxiv.org/abs/2402.16334), M. Satriano and W. V2-000452 | The Gerstenhaber problem for three commuting matrices | exists_finrank_adjoin_quadruple_gt

research solved | proof annotation: False | 官方代码 | 原文线索

The analogue of Gerstenhaber's theorem fails for four pairwise commuting matrices: over any field there are four pairwise commuting 4×4 matrices generating a unital algebra of dimension greater than 4. The standard example is $e_{13}, e_{14}, e_{23}, e_{24}$, whose pairwise products all vanish, so the algebra they generate has dimension 5.

```

The Rule 30 Prize Problems

MODULE CONTEXT: # The Rule 30 Prize Problems **Rule 30** is the elementary cellular automaton with local update $c' = l \oplus (c \lor r)$, the Boolean rule numbered 30 by Wolfram. Started from a single black cell on a bi-infinite row, its **center column** `t ↦ (state t) 0` looks random - it was long *Mathematica*'s default pseudorandom generator - yet nothing about that randomness is proven. In 2019 Wolfram offered the **Rule 30 Prizes** for three questions about it; we formalize the first two. * **Problem 1.** Is the center column non-periodic (never eventually periodic)? * **Problem 2.** Does each color occur on average equally often, i.e. does the running average of the values converge to $1/2$? Problem 3 - whether computing the n-th cell requires at least $O(n)$ work - is omitted. It is model-relative and has no canonical model-independent phrasing. All three are open. *References:* - [Announcing the Rule 30 Prizes](https://writings.stephenwolfram.com/2019/10/announcing-the-rule-30-prizes/), Stephen Wolfram, 2019. - [Rule 30 Prizes](https://rule30prize.org/). - [Wikipedia: Rule 30](https://en.wikipedia.org/wiki/Rule_30).

V2-000455 | The Rule 30 Prize Problems | centerColumn_frequency_half

research open | proof annotation: False | 官方代码 | 原文线索

Rule 30 Prize, Problem 2 (equal frequency). Each color occurs on average equally often in the center column: the set of times at which it is black has natural density $1/2$. This is Wolfram's phrasing that the discrete limit of $\mathrm{Total}[c[t]]/t$ as $t \to \infty$ is $1/2$.

The symbol length of $K^M_n(\mathbb{C}(x_1, \dots, x_m))/p$

MODULE CONTEXT: # The symbol length of $K^M_n(\mathbb{C}(x_1, \dots, x_m))/p$ For a field F and $\ell \ge 1$, the Milnor K-group $K^M_n(F)/\ell$ is generated by the symbols $\{a_1, \dots, a_n\}$ with $a_i \in F^\times$, and the *symbol length* of a class is the least number of symbols in a decomposition of the class as a sum of symbols. The symbol length of $K^M_n(F)/\ell$ is the supremum of the symbol lengths of its classes. When ℓ is invertible in F, the norm residue isomorphism theorem (the Bloch-Kato conjecture, [Voevodsky2011]) gives $K^M_n(F)/\ell \cong H^n(F, \mu_\ell^{\otimes n})$, so this is also the symbol length of Galois cohomology. The **symbol length problem** asks, for a given field F and integers n and ℓ, for a k such that the symbol length of every class in $K^M_n(F)/\ell$ is at most k, for example in terms of a dimension of the field. That a class is a sum of *some* number of symbols is part of the presentation of $K^M_n(F)$ recalled above, so the content lies entirely in the bound. In degree 2, over a field containing a primitive ℓ-th root of unity, Merkurjev and Suslin's theorem [MerkurjevSuslin1983] that the norm residue map is an isomorphism identifies $K^M_2(F)/\ell$ with the ℓ-torsion of the Brauer group and symbols with symbol algebras of degree ℓ; that is the form in which the question is usually studied, namely how many symbol algebras are needed to represent a central simple algebra of exponent ℓ. Becher and Hoffmann [BecherHoffmann2004] named the invariant λ_p in that degree and asked it for exactly the fields considered below (their Question 4.6). The general form stated here is Problem 2.1.3.12 of Krashen's PCMI notes; Krashen notes there that over complex function fields in at least three variables no bound is known beyond Matzri's in degree 2 and the case of ℓ a power of 2, which comes from the theory of quadratic forms, and that very little is known in degree 3 and higher [Krashen2024, §2.1.3.4]. This file states the problem for the rational function fields $\mathbb{C}(x_1, \dots, x_m)$ and a prime $\ell = p$: determine the symbol length of $K^M_n(\mathbb{C}(x_1, \dots, x_m))/p$ as a function of m, n and p, where the symbol length is infinite if there is no bound. What is known: * in degree 0 every symbol is the empty product 1, so $K^M_0(F)/p = \mathbb{Z}/p$ has symbol length $p - 1$ for every field F; * in degree 1 every class of $K^M_1(F)/p = F^\times/(F^\times)^p$ is a single symbol, so the symbol length is at most 1; * $\mathbb{C}(x_1, \dots, x_m)$ has cohomological dimension m [Serre1997, Ch. II, §4.2], so $K^M_n(\mathbb{C}(x_1, \dots, x_m))/p = 0$ for $n > m$ and the symbol length is 0; * $\mathbb{C}(x_1, \dots, x_m)$ is a C_m field (Tsen-Lang, [Lang1952]), so by Matzri's theorem [Matzri2016, Theorem 8.2] every class in $K^M_2(\mathbb{C}(x_1, \dots, x_m))/p^t$ is a sum of at most $t(p^{m-1} - 1)$ symbols when $m \ge 1$; * in degree 2 a tensor product of $m - 1$ symbol algebras of degree p over $\mathbb{C}(x_1, \dots, x_m)$ can be a division algebra, so the symbol length is at least $m - 1$ for $m \ge 1$ [BecherHoffmann2004, Proposition 4.5], by an argument going back to Nakayama. In degree 2, Becher and Hoffmann ask whether that lower bound is the answer, that is whether the symbol length is exactly $m - 1$ [BecherHoffmann2004, Question 4.6]. For $m = n = 2$, the smallest case not settled above, this asks whether every class of $K^M_2(\mathbb{C}(x_1, x_2))/p$ is a single symbol; they call it "a striking open question" and note that it holds for $p \le 3$ by a theorem of Artin [BecherHoffmann2004, Introduction]. Since $m - 1$ does not involve p, their question is an instance of the expectation recorded in [Krashen2024, §2.1.3.4] that a bound can be taken independent of ℓ. See also the survey [Krashen2016]. The definitions `MilnorK`, `MilnorK.symbol`, `MilnorK.grade` and `MilnorK.symbolLengthBounds` are in `FormalConjecturesForMathlib/FieldTheory/MilnorKTheory.lean`. *References:* - [Krashen2024] D. The Auslander-Reiten conjecture

MODULE CONTEXT: # The Auslander-Reiten conjecture **Auslander-Reiten conjecture.** Let Λ be an Artin algebra and let M be a finitely generated Λ-module with $\operatorname{Ext}^i_\Lambda(M, M) = 0$ and $\operatorname{Ext}^i_\Lambda(M, \Lambda) = 0$ for all $i > 0$. Then M is projective. An *Artin algebra* is a ring Λ that is an algebra over a commutative Artinian ring A and is finitely generated as an A-module. Auslander and Reiten [AR75] derived this from the generalized Nakayama conjecture. The conjecture for Artin algebras is false: an internal OpenAI model gave an explicit counterexample in September 2026 [OAI26], a finite-dimensional algebra over the field $\mathbb{F}_2(q, H_1, H_2)$ with a finite-dimensional non-projective module satisfying both vanishing conditions. The commutative version, obtained by replacing Λ with a commutative Noetherian ring R, is open and is what the commutative algebra literature calls the Auslander-Reiten conjecture. The two hypotheses are together equivalent to $\operatorname{Ext}^i_R(M, R \oplus M) = 0$ for all $i > 0$. Known cases of the commutative version include: R a locally excellent Cohen-Macaulay normal ring containing $\mathbb Q$ [HL04]; R a Gorenstein normal ring [Ar09]; R a Cohen-Macaulay normal ring [KOT22]; and, most generally, R any normal ring [Ki23]. Auslander, Ding and Solberg [ADS93] proved it for local complete intersections. The commutative version is open in general, already for commutative Noetherian local rings. *References:* - [AR75] M. V2-000470 | The Auslander-Reiten conjecture | auslander_reiten

research solved | proof annotation: True | 官方代码 | 原文线索

The Auslander-Reiten conjecture [AR75] is false. The conjecture states: let Λ be an Artin algebra and M a finitely generated Λ-module with $\operatorname{Ext}^i_\Lambda(M, \Lambda) = 0$ and $\operatorname{Ext}^i_\Lambda(M, M) = 0$ for all $i > 0$. Then M is projective. That Λ is an Artin algebra is the hypothesis that it is an algebra over some commutative Artinian ring `A` and is finitely generated as an `A`-module. This was disproved by an internal OpenAI model in September 2026 [OAI26]; see the linked Lean proof. The counterexample is a finite-dimensional algebra over the field $\mathbb{F}_2(q, H_1, H_2)$, which is the ring `A` there.

Decidability of reachability for branching vector addition systems

MODULE CONTEXT: # Decidability of reachability for branching vector addition systems A *branching vector addition system* (BVAS) of dimension `d` is given by a finite list of *axioms*, a finite list of *unary rules*, and a finite list of *binary rules*, each of which is a vector in `ℤ^d`. A *configuration* is a vector in `ℕ^d`, which here is represented as a vector `v ∈ ℤ^d` subject to `0 ≤ v`. The set of *reachable* configurations is defined inductively: * every axiom that is a valid configuration (i.e. lies in `ℕ^d`) is reachable; * if `v` is a reachable configuration, `r` is a unary rule and `v + r ∈ ℕ^d`, then `v + r` is reachable; * if `v₁, v₂` are both reachable configurations, `r` is a binary rule and `v₁ + v₂ + r ∈ ℕ^d`, then `v₁ + v₂ + r` is reachable. Modelling axioms as vectors in `ℤ^d` and only counting the non-negative ones as reachable yields the same set of reachable configurations as the usual definition in which axioms are required to lie in `ℕ^d`. Branching vector addition systems are distinguished from ordinary vector addition systems (VAS) by allowing binary rules. VAS reachability is known to be decidable. *References:* - [The covering and boundedness problems for branching vector addition systems](https://drops.dagstuhl.de/entities/document/10.4230/LIPIcs.FSTTCS.2009.2317) (*Stéphane Demri, Marcin Jurdziński, Oded Lachish, Ranko Lazić*, FSTTCS 2009) Gives a similar definition of BVAS, and compares it to related equivalent definitions. - [On the Reachability Problem for Two-Dimensional Branching VASS](https://drops.dagstuhl.de/entities/document/10.4230/LIPIcs.MFCS.2025.22) by *Clotilde Bizière, Thibault Hilaire, Jérôme Leroux, Grégoire Sutre*, MFCS 2025, which settles the two-dimensional case and states that "the decidability status of the reachability problem for BVASS remains open in higher dimensions". - [The General Vector Addition System Reachability Problem by Presburger Inductive Invariants](https://arxiv.org/abs/1009.1076) by *Jérôme Leroux* (2010), for the decidability of reachability for ordinary VAS. - [Solving the Reachability Problem for Branching Vector Addition Systems via Semilinear Inductive Invariants](https://arxiv.org/abs/2607.09558) by *Clotilde Bizière, Jérôme Leroux, Grégoire Sutre* (2026), a recent preprint claiming a positive resolution to the conjecture: reachability for branching vector addition systems is decidable.

V2-000471 | Decidability of reachability for branching vector addition systems | reachability_decidable

research solved | proof annotation: False | 官方代码 | 原文线索

The reachability problem for branching vector addition systems is decidable. That is, the predicate taking a dimension `d`, a branching vector addition system `b` of dimension `d` and a target vector `t ∈ ℤ^d`, and returning whether `t` is reachable in `b`, is a computable predicate. Note that the dimension is part of the input: a single algorithm must work for all dimensions. As of August 2026, the solution is quite recently announced and is not yet peer-reviewed.

```
theorem reachability_decidable :
ComputablePred fun p : Σ d : ℕ, Bvas d × (Fin d → ℤ) => p.2.1.Reachable p.2.2

The Catch-Up game and conjecture

MODULE CONTEXT: # The Catch-Up game and conjecture The game **Catch-Up** (Isaksen-Ismail-Brams-Nealen, 2015) is a two-player, perfect-information game played on a finite nonempty set `S` of positive integers. Each time a player removes a number from `S`, that number is added to the player's score. **Rules.** * The scores start at `0`. Player `p1` starts by removing **exactly one** number from `S`. * After the first move, players alternate turns. On a turn, the current player removes **one or more** numbers from `S`, one at a time, and must keep removing numbers until their score becomes **at least** the opponent's score; before the final pick they must remain **strictly behind**. * If the current player cannot catch up (in particular, even taking all remaining numbers would still leave them behind), the game ends immediately: the current player receives all remaining numbers. When `S` is empty, the player with higher score wins; equal scores give a draw. In this file we define: * `Player` and `Outcome`, * the recursive evaluator `value` (optimal play), * the conjecture `value_of_even_mul_succ_self_div_two`. ## Example For `S = {1,2,3,4}` one play is: `p1` takes `2`, `p2` takes `1` then `4`, and `p1` takes `3`, ending with scores `(5,5)`. ## References A. Isaksen, M. Ismail, S. J. Brams, A. Nealen, *Catch-Up: A Game in Which the Lead Alternates,* Game & Puzzle Design 1(2), 38-49 (2015).

Claude's Cycles

MODULE CONTEXT: # Claude's Cycles *Reference:* [Claude's Cycles](https://www-cs-faculty.stanford.edu/~knuth/papers/claude-cycles.pdf) by *Donald E. Knuth* (2026) Fix `m ≥ 2`. Consider the directed graph with vertex set `(ZMod m)³`, where from each vertex `(i, j, k)` there are directed arcs to `(i+1, j, k)`, `(i, j+1, k)`, and `(i, j, k+1)` (arithmetic mod `m`). The goal is to partition all `3m³` directed arcs into three edge-disjoint directed Hamiltonian cycles (each of length `m³`). Knuth describes an explicit construction, found by Claude (Anthropic), that achieves this decomposition for all odd `m ≥ 3`. The case `m = 2` is known to be impossible [Aub82]. The even case `m > 2` is also settled. Knuth's paper says so in its final section, added in the 14 April 2026 revision: "Breaking news: The problem for even values of m is no longer in doubt!" Ho Boon Suan's algorithm [Ho26] is proved correct for even `m ≥ 8` in [GPT26], and Aquino-Michaels [AM26] gives a decomposition for the even case that is simpler. The statement below starts at `m = 4`, which is below the range [GPT26] covers, so it also rests on the explicit solutions in [Kn26], whose header gives even `m ≥ 4`. ## References - [Knu26] D. E. The Courtade-Kumar (most informative Boolean function) conjecture

MODULE CONTEXT: # The Courtade-Kumar (most informative Boolean function) conjecture Let X be uniform on the Boolean cube $\{0,1\}^n$. Independently of X, let the coordinates of Z be i.i.d. Bernoulli random variables with parameter $p \in [0, 1]$, and put $Y = X \oplus Z$, so that Y is the output of n independent binary symmetric channels with crossover probability p on input X. The **Courtade-Kumar conjecture** asserts that for every Boolean function $f : \{0,1\}^n \to \{0,1\}$, $I(f(X); Y) \le 1 - h(p)$, where mutual information and binary entropy are measured in bits. The usual restriction to $p \in [0, 1/2]$ is equivalent to the range used here. For $p > 1/2$, complementing every output bit replaces Z by its bitwise complement, which is i.i.d. Bernoulli($1 - p$) noise still independent of X; this bijective relabelling of the output preserves $I(f(X); Y)$, and $h(1 - p) = h(p)$. This file contains two formulations: * `CourtadeKumar.courtade_kumar` is the elementary finite-sum statement used by the external Lean proof and its comparator check. Its definitions and statement are retained unchanged. * `CourtadeKumar.variants.courtade_kumar_random_variable` is the random-variable formulation. Its product-law hypothesis specifies a uniform input and independent i.i.d. Bernoulli channel noise, and its conclusion is about the mutual information of the actual random variables. `CourtadeKumar.courtade_kumar_iff_random_variable` proves that the two formulations are equivalent, without using either research statement. Shannon entropy and mutual information of finite-valued random variables are defined in `FormalConjecturesForMathlib.InformationTheory.FiniteEntropy`. For $n \ge 1$, coordinate dictators attain the bound: $I(X_i; Y) = I(X_i; Y_i) = 1 - h(p)$, since the other output coordinates are independent of (X_i, Y_i). The test `mutualInfo_dictator` checks $n = 1$. *References:* - [CK14] T. A. Courtade and G. R. Kumar, *Which Boolean functions maximize mutual information on noisy inputs?*, IEEE Trans. Inf. Theory 60 (2014), no. 8, 4515-4525. Independent work on the conjecture from September 2026, in alphabetical order: - [CGJLMNW26] Z. Chen, A. Gohari, A. Javanmard, H. Lin, V. Mirrokni, C. Nair, D. P. Woodruff, *A Proof of the Most Informative Boolean Function Conjecture*, [arXiv:2609.24931](https://arxiv.org/abs/2609.24931). ```

FC-CourtadeKumar.courtade_kumar

V2-000481 | The Courtade-Kumar (most informative Boolean function) conjecture | courtade_kumar_random_variable

research solved | proof annotation: True | 官方代码 | 原文线索

The Courtade-Kumar conjecture, in random-variable form. The pushforward in the hypothesis is the joint distribution of (X, Z). The uniform measure on `Cube n` is the law of n i.i.d. Bernoulli($1/2$) bits. The product law makes the coordinates of Z i.i.d. Bernoulli(p) and makes the whole noise vector independent of X. In `bernoulliMeasure true false p`, `true` has probability p and denotes a flip. Conditional on X, $Y = X \oplus Z$ flips each input coordinate independently with probability p: this is the memoryless binary symmetric channel with crossover probability p from X to Y. Every Boolean function is allowed, including constants. All maps between these finite discrete types are measurable, so $f \circ X$ and Y are measurable. The conclusion is $I(f(X); Y) \le 1 - h(p)$ in bits, for the entire output vector Y. The linked proof proves the elementary statement `CourtadeKumar.courtade_kumar`, and `CourtadeKumar.courtade_kumar_iff_random_variable` transfers it to this formulation.

De Giorgi's conjecture

MODULE CONTEXT: # De Giorgi's conjecture This file states a conjecture of De Giorgi about entire solutions to $Δ u + u - u^3 = 0$. The conjecture is a rigidity theorem: in spatial dimension $n ≤ 8$, the level sets of bounded solutions which satisfy $∂₁u > 0$ everywhere are hyperplanes. It has been shown that the condition $n ≤ 8$ is sharp. The main theorems are: - `DeGiorgi_le_eight`: the conjecture holds in dimension $n ≤ 8$. - `DeGiorgi_ge_nine`: the conclusion of the conjecture does not hold if $n ≥ 9$. The cases $1 ≤ n ≤ 8$ are also listed individually to enable partial solutions. The cases $1 ≤ n ≤ 3$ are solved, while $4 ≤ n ≤ 8$ remains open. ## Existing results - The case $n = 1$ trivially holds (u is injective since $∂_1 u > 0$). - The case $n = 2$ was proven by Ghoussoub and Gui. - The case $n = 3$ was proven by Ambrosio and Cabré. - The case $4 ≤ n ≤ 8$ was proven under an extra assumption by Savin. - The counterexample for $n ≥ 9$ was proven by Del Pino, Kowalczyk, and Wei. ## References * [Ghoussoub, Gui](https://doi.org/10.1007/s002080050196), Mathematische Annalen 311 (1998) proves the conjecture for $n = 2$. * [Ambrosio, Cabré](https://doi.org/10.1090/S0894-0347-00-00345-3), Journal of the American Mathematical Society 13 (2000) proves the conjecture for $n = 3$. * [Savin](https://doi.org/10.4007/annals.2009.169.41), Annals of Mathematics 169 (2009) proves the case $4 ≤ n ≤ 8$ under an additional assumption. * [Del Pino, Kowalczyk, Wei](http://dx.doi.org/10.4007/annals.2011.174.3.3), Annals of Mathematics 174 (2011) shows that the condition $n ≤ 8$ is sharp.

The Eisenbud-Green-Harris conjecture

MODULE CONTEXT: # The Eisenbud-Green-Harris conjecture Let $S = k[x_1, \dots, x_n]$ with $x_1 > x_2 > \dots > x_n$ and let $I \subseteq S$ be a homogeneous ideal. The *Hilbert function* of I is $d \mapsto \dim_k I_d$. A *monomial ideal* is an ideal generated by monomials. A monomial ideal L is *lex* if for any two monomials u, v of the same degree with $u >_{\mathrm{lex}} v$ we have $u \in L$ whenever $v \in L$. Macaulay's theorem says that every homogeneous ideal has the same Hilbert function as a unique lex ideal. **Eisenbud-Green-Harris conjecture.** If I contains a regular sequence of forms of degrees $d_1 \le \dots \le d_c$, then there is a lex ideal L such that I has the same Hilbert function as $L + (x_1^{d_1}, \dots, x_c^{d_c})$. Eisenbud, Green and Harris proposed the conjecture in [EGH93] and [EGH96] to generalise a theorem of Castelnuovo and Cayley-Bacharach type theorems for zero-dimensional subschemes of $\mathbb P^m$. It refines Macaulay's theorem, which is the case $c = 0$. The conjecture is open in general. It holds when the regular sequence is monomial, by the Clements-Lindström theorem [CL69], and when the degrees grow quickly, namely when $d_i \ge \sum_{j < i} (d_j - 1)$ for all $i \ge 3$: this is due to Caviglia and De Stefani [CDS20], improving on Caviglia and Maclagan [CM08], who assumed the strict inequality. Other known cases are $c \le 2$, and $d_1 = \dots = d_c = 2$ with $c \le 5$ by Güntürkün and Hochster; [CDS20] lists these with references. The Lex-plus-powers conjecture, attributed to Charalambous and Evans, predicts that the ideal $L + (x_1^{d_1}, \dots, x_c^{d_c})$ above also has the largest graded Betti numbers among all ideals with that Hilbert function containing a regular sequence in those degrees. The Eisenbud-Green-Harris conjecture is its $i = 0$ case [CS18]. It is not formalised here. The Hilbert function `MvPolynomial.hilbertFunction`, lex ideals `MvPolynomial.IsLexIdeal` and the ideal of pure powers `MvPolynomial.purePowersIdeal` are defined in `FormalConjecturesForMathlib.RingTheory.MvPolynomial.LexPlusPowers`. *References:* - [EGH93] D. Is a finite locally free group scheme killed by its order?

MODULE CONTEXT: # Is a finite locally free group scheme killed by its order? A finite locally free group scheme of rank `n` is the group scheme analogue of a finite group of order `n`. Lagrange's theorem gives `g ^ n = 1` in a finite group of order `n`, and Grothendieck asked whether the `n`-th power map of such a group scheme is trivial. The answer is affirmative over a reduced base and for commutative group schemes, and negative in general. Which exponents kill every group scheme of a given rank is open. A group scheme is represented here by its coordinate Hopf algebra `A` over the base ring `R`. `A` is not assumed to be cocommutative, so the group scheme is not assumed to be commutative. The base is a ring rather than a scheme: a finite locally free group scheme is affine over its base, and being killed by `m` is local on the base, so nothing is lost. *References:* - [M. Demazure and A. Grothendieck, *Schémas en groupes* (SGA 3), re-edition by P. Gille and P. Polo](https://webusers.imj-prg.fr/~patrick.polo/SGA3/). Exp. VIII, Rem. 7.3.1 poses the question; an editors' note records that the re-edition drops the commutativity assumption there. Exp. VIIA, Prop. 8.5 settles the case of a field and Cor. 8.5.2 the case of a reduced base. - [R. Schoof, *Is a finite locally free group scheme killed by its order?*](https://reneschoof.github.io/schoof_oortAAG.pdf), a survey of the question and of the cases that are known, written before the counterexample - [J. Tate and F. Oort, *Group schemes of prime order*](https://www.numdam.org/item/ASENS_1970_4_3_1_1_0/), p. 4 for Deligne's theorem and p. 5, which records the general question as open in 1970 - [Mathlib, *A finite free group scheme of rank four that is not killed by four*](https://leanprover-community.github.io/mathlib4_docs/Counterexamples/GrothendieckPower.html), the counterexample

V2-000499 | Is a finite locally free group scheme killed by its order? | killed_by_rank

research solved | proof annotation: True | 官方代码 | 原文线索

Grothendieck's question: is every finite locally free group scheme of rank n, over every commutative ring, killed by n? The answer is no. There is a commutative Hopf algebra of rank 4 over a finite non-reduced ring whose fourth power map is not trivial; its eighth power map is trivial. The formalised counterexample lives in `Type`, so the statement quantifies over rings and algebras in `Type`.

```
theorem killed_by_rank :
¬ ∀ n : ℕ+, IsUniversalKillingExponent.{0, 0} n n
```

FC-FiniteLocallyFreeGroupSchemeExponent.killed_by_rank

V2-000500 | Is a finite locally free group scheme killed by its order? | optimal_exponent

research open | proof annotation: False | 官方代码 | 原文线索

Determine the function assigning to each positive integer n the least positive integer m such that every finite locally free group scheme of rank n, over every commutative ring, is killed by m. The value is 0 if there is no such m, since `sInf ∅ = 0` in `ℕ`. As in `killed_by_rank`, the rings and algebras are in `Type`. Grothendieck asked whether this least exponent is n itself. It is not, already for $n = 4$. If some positive exponent kills every group scheme of rank n, then these exponents are the multiples of the least one, so minimality for $\le$ agrees with minimality for divisibility.

```
theorem optimal_exponent :
∀ n, sInf ((↑) '' {m | IsUniversalKillingExponent.{0, 0} n m} : Set ℕ) = optimal_exponent.answer n

Main conjecture on fusible numbers

MODULE CONTEXT: # Main conjecture on fusible numbers *References:* - [Fusible numbers and Peano Arithmetic](https://arxiv.org/abs/2003.14342), by Jeff Erickson, Gabriel Nivasch, and Junyan Xu. - [Fusible numbers and Peano Arithmetic](https://doi.org/10.46298/lmcs-18%283%3A6%292022), Logical Methods in Computer Science, Volume 18, Issue 3 (July 28, 2022).

V2-000501 | Main conjecture on fusible numbers | conj_7_1

research open | proof annotation: False | 官方代码 | 原文线索

If `x` is a fusible number and `y` is its successor, then the interval `[x + 1, y + 1)` can be divided into intervals `[ℓₙ, ℓₙ₊₁)`, such that the fusible numbers in `[ℓₙ, ℓₙ₊₁)` are obtained by fusing the `n + 1`st successor of `x` with a fusible number. This formalization differs from Conjecture 7.1 in the paper in four ways: (1) it is obtained from Conjecture 7.1 by plugging in `n + 1` into `n`, which simplifies the expressions and removes the need to assume `n ≥ 1`; (2) the `n + 1`st successor `s^(n+1)(x)` is replaced by the explicit value `x + (2 - 1 / 2 ^ n) * m`; (3) instead of defining `y` to be the successor of `x`, we assert that there is no fusible number strictly between `x` and `y`; (4) instead of using `∃ z, IsFusible z ∧ q = s^(n+1)(x) ~ z` we use the value of `z` determined by the equality, namely `z = 2 * q - 1 - s^(n+1)(x)`, and it is easy to see `z ∈ [x + 1 - m / 2 ^ n, x + 1)` as required.

```
theorem conj_7_1 (x y q : ℚ) (n : ℕ) (fus_x : IsFusible x) (fus_y : IsFusible y) (lt : x < y)
(nmem_Ioo : ∀ z, IsFusible z → z ∉ Set.Ioo x y) :
let m := y - x
let ℓ (n : ℕ) := y + 1 - m / 2 ^ n
IsFusible q → q ∈ Set.Ico (ℓ n) (ℓ (n + 1)) → IsFusible (2 * q - 1 - x - (2 - 1 / 2 ^ n) * m)
```

Kaplansky's problem on the values of the u-invariant

MODULE CONTEXT: # Kaplansky's problem on the values of the u-invariant The u-invariant $u(F)$ of a field F is the largest dimension of an anisotropic quadratic form over F, or ∞ if there is no largest one; that is, $u(F) = n$ exactly when `IsGreatest (QuadraticForm.anisotropicDims F) n`. Following [Kaplansky1953] and [MerkurjevParimala2025, §5.1], all fields are of characteristic not 2. Kaplansky introduced the invariant (his $C(F)$) in [Kaplansky1953, p. 201], proved that $u(F) \ne 3$ (his Theorem 2), observed that every power of 2 occurs (his Theorem 3 gives $u(F((t))) = 2u(F)$), and conjectured that $u(F)$ is a power of 2 whenever it is finite [Kaplansky1953, p. 202]. It is classical that $u(F) \notin \{3, 5, 7\}$ [Lam2005, Proposition XI.6.8], [EKM2008, Corollary 36.4]. Merkurjev disproved Kaplansky's conjecture with a field of u-invariant 6 [Merkurjev1989] and then showed that every positive even integer is a u-invariant [Merkurjev1991]. Izhboldin constructed a field of u-invariant 9 [Izhboldin2001], and Vishik fields of u-invariant $2^r + 1$ for every $r \ge 3$ [Vishik2009]. A 2026 preprint of Karpenko constructs fields of u-invariant n for every n that is neither of the form $2^r - 1$ nor of the form $2^r - 3$ [Karpenko2026]; as of September 2026 it is not yet peer-reviewed. The problem (`u_invariant_values`) is to determine which integers are u-invariants of fields. The survey [MerkurjevParimala2025, §5.1] records the expectation that every odd integer ≥ 9 is a u-invariant (`u_invariant_values.variants.odd`). Given the results above, the problem is open exactly for the integers $2^r - 1$ and $2^r - 3$ with $r \ge 4$, the smallest of which are 13 and 15. *References:* - [Kaplansky1953] I. V2-000510 | Kaplansky's problem on the values of the u-invariant | u_invariant_values

research open | proof annotation: False | 官方代码 | 原文线索

The values of the u-invariant, stated as in [MerkurjevParimala2025, §5.1]: which integers are u-invariants of fields (of characteristic not 2)? The question goes back to [Kaplansky1953], who conjectured that only powers of 2 occur (`u_invariant_values.variants.kaplansky_conjecture`). Every positive even integer is a u-invariant (`u_invariant_values.variants.even`), 3, 5 and 7 are not (`u_invariant_values.variants.not_three`, `u_invariant_values.variants.not_five`, `u_invariant_values.variants.not_seven`), and it is expected that every odd integer ≥ 9 is (`u_invariant_values.variants.odd`). Granting the preprint [Karpenko2026] (`u_invariant_values.variants.karpenko`), the answer is known for every n except $n = 2^r - 1$ and $n = 2^r - 3$ with $r \ge 4$.

theorem u_invariant_values :
∀ n, n ∈ u_invariant_values.answer ↔ IsUInvariant n

Kotzig's Conjecture

MODULE CONTEXT: # Kotzig's Conjecture *Reference:* A. Kotzig, cited in A. Rosa, *On certain valuations of the vertices of a graph*, Theory of Graphs (Internat. Sympos., Rome, 1966), Gordon and Breach, 1967, pp. 349-355. Kotzig conjectured that for every n, the complete graph K_{2n+1} decomposes into copies of any n-edge tree via cyclic shifts of a single embedding. This is strictly stronger than Ringel's conjecture; see `Paper/RingelConjecture.lean`. The large-n case is proved by Montgomery-Pokrovskiy-Sudakov; see `Arxiv/2001.02665/RingelConjecture.lean`.

V2-000511 | Kotzig's Conjecture | kotzig_conjecture

research open | proof annotation: False | 官方代码

For any tree T with n edges, the complete graph K_{2n+1} decomposes into $2n+1$ edge-disjoint copies of T via cyclic shifts of a single embedding. The $2n+1$ copies are $f_0, f_1, \dots, f_{2n}$ where $f_i(v) = f_0(v) + i$ for all vertices v - each copy is obtained by adding $i \pmod{2n+1}$ to every vertex of the base copy. This is strictly stronger than `RingelConjecture.ringel_conjecture`.

theorem kotzig_conjecture {V : Type} [Finite V]
(T : SimpleGraph V) (hT : T.IsTree)

Monochromatic quantum graphs (inherited vertex colorings)

MODULE CONTEXT: # Monochromatic quantum graphs (inherited vertex colorings) This file studies the existence of *monochromatic quantum graphs*: edge-coloured, edge-weighted complete graphs whose perfect matchings induce vertex colourings, with the property that - every **non-monochromatic** inherited vertex colouring has total weight `0`, while - each of the `D` **monochromatic** colourings has total weight `1`. In the quantum-optics motivation, such a construction corresponds to generating high-dimensional multipartite GHZ-type states using probabilistic pair sources and linear optics (without additional resources), where interference patterns can be expressed as weighted sums over perfect matchings. ## Main questions (informal) - For `N = 4` and `D ≥ 4`, does there exist such a graph/weighting? - For even `N ≥ 6` and `D ≥ 3`, does there exist such a graph/weighting? ## Formalisation sketch A quantum graph with `N` vertices and `D` colours can be encoded by a weight function `W : EdgeN N D α → α` (for a coefficient domain `α`). For each assignment of vertex indices `ι : V N → Fin D`, we define a perfect-matching sum `pmSumN N D W ι` (a sum over perfect matchings, where each matching contributes the product of the corresponding edge weights determined by `ι`). The equation system `EqSystemN N D W` requires `pmSumN N D W ι = 1` iff `ι` is constant (all entries equal), and `0` otherwise. The open conjectures in this file ask for non-existence/existence of such `W` over various coefficient domains (e.g. `ℂ`, `ℝ`, `ℤ`, and restricted integer weights). ## References * [Krenn2017] M. Energy-critical NLS in three dimensions.

MODULE CONTEXT: # Energy-critical NLS in three dimensions. This file states an a priori estimate for the energy-critical nonlinear Schrödinger equation on $ℝ^3$. By 'soft' arguments, this bound implies global well-posedness in the energy space, scattering, asymptotic completeness, and uniform regularity (all of which are less elementary to state). This is remarked on p. 770 and p. 793 in the referenced article which first proved the a priori bound. The main theorem is: - `NLS_apriori`: a bound on the space-time L^10 norm in terms of the initial energy for local smooth solutions to the NLS equation. ## References * [Colliander, Keel, Staffilani, Takaoka, Tao](https://doi.org/10.4007/annals.2008.167.767), Annals of Mathematics 167 (2008) proves the a priori estimate, and thereby, global well-posedness.

Parities of partition numbers

MODULE CONTEXT: # Parities of partition numbers There are several conjectures on parities of partition numbers. The most famous conjecture is the Parkin-Shanks conjecture, which states that the natural density of `n` where the partition number `p(n)` is even (resp. odd) exists and equals `1/2`. There are several related (weaker) results toward the conjecture. Kolberg showed that `p(n)` takes each parity infinitely often. Subbarao conjectured that every arithmetic progression `r (mod t)` contains infinitely many `n` with `p(n)` even and infinitely many `n` with `p(n)` odd; the even case was proved by Ono and the odd case by Radu. Quantitative lower bounds for the number of `n ≤ X` with `p(n)` even (resp. odd) have also been studied. The best known bounds are `≫ √X log log X` for even values (Bellaïche-Nicolas) and `≫ √X` for odd values (Zheng, in an appendix to Ono-Swaminathan). Ono-Swaminathan also proved that both parities occur infinitely often along the quadratic progressions `(D m² + 1) / 24`, and Ono conjectured the same for every nonconstant integer-valued polynomial that is eventually positive. *References:* * [On the distribution of parity in the partition function](https://www.jstor.org/stable/2003251), T. Pfister's problem on the Pythagoras number of $\mathbb{R}(X_1, \dots, X_n)$

MODULE CONTEXT: # Pfister's problem on the Pythagoras number of $\mathbb{R}(X_1, \dots, X_n)$ The Pythagoras number $p(K)$ of a field K is the least p such that every sum of squares in K is a sum of p squares, i.e. the least element of `pythagorasBounds K`. Artin's solution of Hilbert's 17th problem shows that a positive semidefinite rational function in $\mathbb{R}(X_1, \dots, X_n)$ is a sum of squares, and Pfister showed that 2^n squares suffice ([Pfister1967, Theorem 1]; for the field, Corollary 1 of Theorem 2 in [Pfister1971]). Since sums of squares are positive semidefinite, $p(\mathbb{R}(X_1, \dots, X_n)) \le 2^n$ [Pfister1995, p. 95]. Problem 1 of [Pfister1971, §4] asks for the true value of $p(\mathbb{R}(X_1, \dots, X_n))$. The question is often posed as: is $p(\mathbb{R}(X_1, \dots, X_n)) = 2^n$, i.e. is Pfister's bound optimal? See e.g. [Benoist2017, Question 0.2]. Problem 1 itself quotes the lower bound $n + 1 \le p(\mathbb{R}(X_1, \dots, X_n))$ from Cassels' theorem [Cassels1964]. For $n \ge 2$ the best known bounds are $n + 2 \le p(\mathbb{R}(X_1, \dots, X_n)) \le 2^n$ [Pfister1995, p. 97], where the lower bound follows from the Cassels-Ellison-Pfister theorem [CEP1971]. The bounds agree for $n = 2$, so the value is known for $n \le 2$ and open for every $n \ge 3$. The survey [MerkurjevParimala2025, §5.2] records the question as open even for $\mathbb{R}(X_1, X_2, X_3)$ (Question 5.7). *References:* - [Pfister1971] A. Pfister, *Sums of squares in real function fields*, pp. 297-300 in Actes du Congrès International des Mathématiciens, Tome 1 (Nice, 1970), Gauthier-Villars, 1971, [IMU scan](https://www.mathunion.org/fileadmin/ICM/Proceedings/ICM1970.1/ICM1970.1.ocr.pdf). - [Pfister1967] A. SAT has no p-optimal proof system (Pudlák's conjecture `SAT` [Pu17]). No proof system for `SAT` p-simulates every other proof system for `SAT`. Since the existence of a p-optimal proof system depends only on the polynomial-time many-one degree of the language [KMT03], the conjecture is stated here for an arbitrary NP-complete language. Equivalently [Pu17], for every consistent polynomial-time axiomatized theory `T ⊇ S¹₂` there is a proof system for `SAT` whose soundness `T` cannot prove.

Lagarias' Criterion. A refinement of Robin's criterion: the Riemann Hypothesis is equivalent to $$ \sigma(n) < H_n + e^{H_n}\log H_n $$ for all $n \geq 2$, where $H_n = 1 + 1/2 + \cdots + 1/n$ is the nth harmonic number. Note that [Co26] states this for all $n \geq 1$, but at $n = 1$ both sides equal 1; Lagarias' original formulation is the non-strict inequality for all $n \geq 1$, with equality only at $n = 1$.

Weil's Positivity Criterion. The Riemann Hypothesis is equivalent to the non-positivity of Weil factor sums on the convolution of test functions. In [Co26] this is expressed as $$ \sum_v W_v(g\star g^*) \leq 0 $$ for all compactly-supported smooth functions $g : \mathbb{R}_+^{\times} \to \mathbb{C}$ such that the Mellin transform of g vanishes at $\pm i / 2$, where $g^*(x) := \bar{g}(x^{-1})$ and W_v are the multiplicative Weil factors defined in [Co26]. We formalise this as the corresponding additive statement (via $x = e^u$), since convolution in mathlib is additive, and restrict to real-valued test functions g, which suffices for the equivalence.

```

Moments of the Riemann zeta function on the critical line

MODULE CONTEXT: # Moments of the Riemann zeta function on the critical line The moments $\frac{1}{T}\int_0^T |\zeta(1/2 + it)|^{2k}\,dt$ are conjectured to be asymptotic to $c_k (\log T)^{k^2}$ for some constants c_k. This is a theorem for $k = 1$ (Hardy-Littlewood, $c_1 = 1$) and $k = 2$ (Ingham, $c_2 = 1/(2\pi^2)$), and these are the only proven cases. Conrey-Ghosh and Conrey-Gonek conjectured $c_3 = 42 a_3 / 9!$ and $c_4 = 24024 a_4 / 16!$, with a_k the arithmetic factor $a_k = \prod_p (1 - 1/p)^{k^2} \sum_{m \ge 0} \binom{m+k-1}{m}^2 p^{-m}$; Keating-Snaith conjectured $c_k = a_k f_k$ with $f_k = \prod_{j=0}^{k-1} j!/(j+k)!$ from random matrix theory, recovering $g_k = (k^2)!\,f_k = 1, 2, 42, 24024$. The statements and constants below are taken from §3.4.5 of [Co26]. *References:* - [Co26] A. Ringel's Conjecture

MODULE CONTEXT: # Ringel's Conjecture *Reference:* G. Ringel, *Problem 25*, in *Theory of Graphs and its Applications* (Proc. Sympos. Smolenice, 1963), Academia, Prague, 1964. Ringel's conjecture (1963): the complete graph K_{2n+1} decomposes into copies of any tree with n edges. It remains open; the case of all sufficiently large n is proved by Montgomery-Pokrovskiy-Sudakov, see `Arxiv/2001.02665/RingelConjecture.lean`.

V2-000594 | Ringel's Conjecture | ringel_conjecture

research open | proof annotation: False | 官方代码

For any tree T with n edges, the complete graph K_{2n+1} decomposes into $2n+1$ edge-disjoint copies of T. A "copy" of T is the image $T.\text{map}(f_i)$ of T under a vertex embedding $f_i : V \hookrightarrow \text{Fin}(2n+1)$; the copies are pairwise edge-disjoint and together cover every edge of K_{2n+1}.

```
theorem ringel_conjecture {V : Type} [Finite V]

Serre's uniformity conjecture over the rationals

MODULE CONTEXT: # Serre's uniformity conjecture over the rationals Is there a bound C, independent of the non-CM elliptic curve $E/\mathbb{Q}$, such that the Galois action on $E[p]$ is surjective onto $\mathrm{GL}_2(\mathbb{F}_p)$ for every prime $p > C$? This is the $\mathbb{Q}$ case of Serre's question [Ser72], recalled in the introduction of [Lem17]. We express surjectivity without choosing a basis: every additive automorphism of $E[p]$ must be induced by an element of $G_{\mathbb{Q}}$. For prime p, these automorphisms are exactly the $\mathbb{F}_p$-linear automorphisms. The non-CM condition uses the classification of rational CM j-invariants. *References:* - [Ser72] J.-P. Serre, *Propriétés galoisiennes des points d'ordre fini des courbes elliptiques*. Inventiones Mathematicae 15 (1972), 259-331. https://doi.org/10.1007/BF01405086 - [Lem17] P. Lemos, *Serre's uniformity conjecture for elliptic curves with rational cyclic isogenies*, introduction. https://arxiv.org/abs/1702.01985

Size, Order, and Connected Domination

MODULE CONTEXT: # Size, Order, and Connected Domination *References:* - [S. Mukwembi, _Size, order, and connected domination_, Canad. Math. Bull. 57 (2014), no. 1, 141-144](https://doi.org/10.4153/CMB-2013-020-5)

V2-000598 | Size, Order, and Connected Domination | mukwembi_theorem_2_1

research solved | proof annotation: True | 官方代码 | 原文线索

Theorem 2.1 of [S. Mukwembi, _Size, order, and connected domination_, Canad. Math. Bull. 57 (2014), no. 1, 141-144](https://doi.org/10.4153/CMB-2013-020-5) claims: if G is a connected triangle-free graph of order n and size m with connected domination number γ_c, then $$m \le \frac{(n - \gamma_c)^2}{4} + n - 1.$$ The claim is **false**: the 3-dimensional hypercube Q_3 is a counterexample, with $n = 8$, $m = 12$ and $\gamma_c = 4$, so the asserted bound reads $12 \le (8-4)^2/4 + 8 - 1 = 11$. The gap in the paper's proof (p. 143) is the unjustified assertion that there is an edge uv with $\gamma_c(G) \le \gamma_c(G - \{u, v\})$: in Q_3, removing any adjacent pair of vertices leaves a graph with connected domination number $2 < 4$. The corollaries of the paper (Corollary 2.2 and 2.3, on leaf numbers of triangle-free graphs) remain true; Corollary 2.2 is Graffiti.pc Conjecture 1.1, recorded as `WrittenOnTheWallII.GraphConjecture2.conjecture2`.

Strong Sensitivity Conjecture (`bs(f) ≤ s(f)^2`)

MODULE CONTEXT: # Strong Sensitivity Conjecture (`bs(f) ≤ s(f)^2`) This file formalizes the *strong* sensitivity conjecture, asserting: For every Boolean function `f : {0,1}^n → {0,1}`, `bs(f) ≤ s(f)^2`, where bs(f) denotes block sensitivity and s(f) denotes sensitivity. Huang's theorem proves a *quartic* upper bound, `bs(f) ≤ s(f)^4`, thereby resolving the most widely known form of the sensitivity conjecture. We now ask whether a stronger upper bound holds. Interestingly, the original paper of Nisan and Szegedy, where the sensitivity conjecture first appeared, already speculated that a *quadratic* upper bound might be the correct relation. On the lower bound side, Rubinstein (https://link.springer.com/article/10.1007/BF01200762) constructed Boolean functions exhibiting the first quadratic separation. The best gap known before [OAI26], due to Ambainis and Sun (https://arxiv.org/abs/1108.3494), was `bs(f) ≥ (2/3)·s(f)^2`. In September 2026 an internal OpenAI model disproved the quadratic bound [OAI26]: it constructs total Boolean functions with `bs(f) / s(f)^2` arbitrarily large. *References:* * [OAI26] [A superquadratic separation between sensitivity and block sensitivity](https://github.com/openai/math/blob/adc7f1241b42e322a6451854ab7e4b4c146bf78a/preprints/A-superquadratic-separation-between-sensitivity-and-block-sensitivity-September-25-2026/paper.pdf) by OpenAI, OpenAI Math Release preprint (2026) * [Induced Subgraphs of Hypercubes and a Proof of the Sensitivity Conjecture](https://arxiv.org/abs/1907.00847) by Hao Huang (see Section 3, Concluding Remarks) * [Variations on the Sensitivity Conjecture](https://arxiv.org/abs/1011.0354) by Pooya Hatami, Raghav Kulkarni, and Denis Pankratov (see Question 3.1) * [On the Degree of Boolean Functions as Real Polynomials](https://link.springer.com/article/10.1007/BF01263419) by Noam Nisan, and Mario Szegedy (see Section 4, Open Problems)

V2-000599 | Strong Sensitivity Conjecture (`bs(f) ≤ s(f)^2`) | strong_sensitivity_conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

Strong Sensitivity Conjecture, for every Boolean function `f : {0,1}^n → {0,1}`, `bs(f) ≤ s(f)^2`. We call this the *strong* sensitivity conjecture because the original sensitivity conjecture only asked for a polynomial bound in terms of `s(f)`. Huang's celebrated result (often called the sensitivity theorem) gives a quartic bound, `bs(f) ≤ s(f)^4`, thereby settling the original conjecture. The quadratic bound is false. This was disproved by an internal OpenAI model in September 2026 [OAI26]; see the linked Lean proof.

W., *Proof of the TuDeng Conjecture*, arXiv:2608.14821 (2026)](https://arxiv.org/abs/2608.14821) * [Lean26] [A Lean 4 proof of the count form of the conjecture](https://github.com/ifeelok92/tu-deng-conjecture-lean-formal-proof/blob/3c00561415deedcdc56b9e803042c1d0f15f5d5b/TuDengFormal/FirstExitNat.lean#L529-L535), commit `3c005614`, theorem `TuDeng.FirstExit.tu_deng_conjecture_full` For an integer $k \ge 2$, identify the residues modulo $2^k - 1$ with the integers $0, 1, \dots, 2^k - 2$, and let $w(a)$ denote the binary weight of a (the number of ones in its binary expansion). The Tu-Deng conjecture states that for every residue $t \ne 0$, $$\#\{(a, b) : a + b \equiv t \pmod{2^k - 1},\ w(a) + w(b) \le k - 1\} \le 2^{k-1}.$$ Tu and Deng showed that this combinatorial statement implies that their constructions of Boolean functions (a bent class and a balanced class) achieve optimal algebraic immunity, which is the motivation for the conjecture. They verified the conjecture numerically for $k \le 29$ (Remark 3.1 of the ePrint version). The conjecture is no longer open: [LLX26] and, independently, [Cu26] give complete proofs. [Lean26] is a Lean 4 development of the same bound, stated for the count of natural-number representatives $x < 2^k - 1$ rather than for the set of residue pairs used below.

research solved | proof annotation: False | 官方代码 | 原文线索

The Tu-Deng conjecture. For $k \ge 2$ and a nonzero residue t modulo $2^k - 1$, there are at most 2^{k-1} pairs of residues (a, b) with $a + b = t$ whose binary weights (of their representatives in $0, \dots, 2^k - 2$) sum to at most $k - 1$. Proved in [LLX26] and independently in [Cu26]; see also the Lean development [Lean26].

```
theorem tu_deng_conjecture (k : ℕ) (hk : 2 ≤ k) (t : ZMod (2 ^ k - 1)) (ht : t ≠ 0) :
{p : ZMod (2 ^ k - 1) × ZMod (2 ^ k - 1) |
p.1 + p.2 = t ∧ binaryWeight p.1.val + binaryWeight p.2.val ≤ k - 1}.ncard
≤ 2 ^ (k - 1)
```

Weak tiling problems

MODULE CONTEXT: # Weak tiling problems Problems 4.1, 4.2, and 4.3 from [arxiv/2506.23631](https://arxiv.org/abs/2506.23631). *Reference:* * [Geometric implications of weak tiling](https://arxiv.org/abs/2506.23631) See also `FormalConjectures.Wikipedia.Fuglede` for Fuglede's spectral set conjecture, which motivates the study of weak tilings.

V2-000601 | Weak tiling problems | problem_4_1

research solved | proof annotation: True | 官方代码 | 原文线索

Problem 4.1. Let $\Omega \subset \mathbb{R}$ be a finite union of intervals and ν a weak tiling measure for Ω. Must $\mathrm{supp}(\nu)$ have bounded density? The answer is positive: Kenta Kitamura (KitaKen1 on GitHub) has given a Lean proof ([weak-tiling-bounded-density](https://github.com/KitaKen1/weak-tiling-bounded-density)).

```
theorem problem_4_1 :
∀ (Ω : Set ℝ) (_ : IsFiniteUnionOfIntervals Ω)
(ν : Measure ℝ) (_ : IsWeakTilingMeasure Ω ν), HasBoundedDensity ν.support
```

FC-WeakTiling.problem_4_1

V2-000602 | Weak tiling problems | problem_4_2

research open | proof annotation: False | 官方代码 | 原文线索

Problem 4.2. Let $\Omega \subset \mathbb{R}$ be a finite union of three or more intervals. If Ω weakly tiles its complement, must it also tile its complement properly?

```
theorem problem_4_2 :
∀ (n : ℕ) (_ : 3 ≤ n) (Ω : Set ℝ)
(_ : IsUnionOfNIntervals n Ω) (ν : Measure ℝ) (_ : IsWeakTilingMeasure Ω ν),
∃ T : Set ℝ, IsProperTiling Ω T
```

FC-WeakTiling.problem_4_2

V2-000603 | Weak tiling problems | problem_4_3

research solved | proof annotation: True | 官方代码 | 原文线索

Problem 4.3. Let $\Omega \subset \mathbb{R}$ be a finite union of intervals and ν a weak tiling measure for Ω. Must ν be expressible as a convex combination of proper tiling measures? The answer is negative. An AI-assisted investigation by Kenta Kitamura produced a counterexample for $\Omega = (0,1) \cup (2,3) \cup (12,13) \cup (30,31)$. A finite computation shows that every convex combination of proper tiling measures for this Ω assigns equal mass to $\{7\}$ and $\{15\}$. However, the constructed weak tiling measure ν satisfies $\nu(\{7\}) = \frac{1}{2}$ and $\nu(\{15\}) = 0$, so ν cannot be expressed as a convex combination of proper tiling measures.

```
theorem problem_4_3 :
¬ ∀ (Ω : Set ℝ) (_ : IsFiniteUnionOfIntervals Ω)
(ν : Measure ℝ) (_ : IsWeakTilingMeasure Ω ν),
∃ (T : ℕ → Set ℝ) (c : ℕ → ℝ≥0), (∀ i, IsProperTiling Ω (T i)) ∧ ∑' i : ℕ, c i = 1 ∧
ν = Measure.sum
(fun i => (c i : ℝ≥0∞) • Measure.sum (fun t : T i => Measure.dirac (t : ℝ)))
```

The Bateman-Horn Conjecture Given a finite collection of distinct irreducible polynomials non-constant $f_1, f_2, \dots, f_k \in \mathbb{Z}[x]$ with positive leading coefficients that satisfy the Schinzel condition, the number of positive integers $n \leq x$ for which all polynomials f_i are simultaneously prime is asymptotic to: $$\frac{C}{D} \frac{x}{(\log x)^k}$$ where $D = \prod_i \deg(f_i)$ and C is the Bateman-Horn constant given by the convergent infinite product: $$C = \prod_{p\in\mathbb{P}} (1 - 1/p)^{-k} (1 - \omega_p/p)$$ Here ω_p is the number of residue classes modulo p for which at least one polynomial vanishes. The product is only conditionally convergent: it is the limit as $N \to \infty$ of the partial products over the primes $p < N$. The Schinzel condition ensures that for each prime p, there exists some integer n such that p does not divide the product $f_1(n) f_2(n) \dotsb f_k(n)$, which guarantees the infinite product converges to a positive value.

Beck-Fiala theorem and conjecture

MODULE CONTEXT: # Beck-Fiala theorem and conjecture Discrepancy of bounded-degree set systems. Given sets $S_1, \dots, S_m \subseteq [n]$ such that every element of $[n]$ belongs to at most t of the sets (the system has *degree* at most t), one seeks a colouring $\chi \colon [n] \to \{-1, +1\}$ making every set as balanced as possible, i.e. minimizing the *discrepancy* $\max_i \left|\sum_{j \in S_i} \chi(j)\right|$. The Beck-Fiala theorem (1981) states that every set system of degree at most $t \ge 1$ has discrepancy at most $2t - 1$. The Beck-Fiala conjecture asserts that the truth is much stronger: the discrepancy of a degree-t system is $O(\sqrt{t})$, with a constant independent of n, m and t. Despite considerable attention the bound $2t - 1$ has been improved only slightly: Bukh (2016) proved a bound of the form $2t - \log^* t$ (where $\log^*$ is the iterated logarithm), and Banaszczyk's vector balancing theorem yields $O(\sqrt{t \log n})$. The Komlós conjecture (see `KomlosConjecture.lean`) would imply the Beck-Fiala conjecture, since scaling the incidence vectors of a degree-t system by $1/\sqrt{t}$ produces vectors of Euclidean norm at most 1. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Beck%E2%80%93Fiala_theorem) - [J. Černý Conjecture

MODULE CONTEXT: # Černý Conjecture A **synchronizing word** (also called a reset word) for a deterministic finite automaton (DFA) $M = (Q, \Sigma, \delta)$ is a word $w \in \Sigma^*$ such that reading w from any state always leads to the same single state - formally, $\exists p \in Q, \forall q \in Q, \delta^*(q, w) = p$. A DFA is called **synchronizing** if it admits at least one synchronizing word. The **Černý conjecture** asserts that every synchronizing DFA with n states has a synchronizing word of length at most $(n - 1)^2$. This bound is sharp: the family of Černý automata C_n witnesses it, requiring exactly $(n - 1)^2$ steps. **Status:** Open. The best known upper bound is $\left(\frac{7}{48} + \frac{2 \cdot 15625}{1597536}\right) n^3 + o(n^3) \approx 0.1654\,n^3$ (Shitov, 2019). The bound $(n - 1)^2$ has been verified for small n and for special classes of automata (e.g., Eulerian, aperiodic, cyclic automata). We use Mathlib's `DFA α σ` (from `Mathlib.Computability.DFA`), together with the auxiliary `DFA.IsSynchronizingWord` and `DFA.IsSynchronizing` predicates defined in `FormalConjecturesForMathlib.Computability.DFA`. *References:* - [Wikipedia: Synchronizing word](https://en.wikipedia.org/wiki/Synchronizing_word) - J. Babai-Seress Conjectures on the Diameter of Finite Groups

MODULE CONTEXT: # Babai-Seress Conjectures on the Diameter of Finite Groups *References:* - [Wikipedia, *Diameter (group theory)*](https://en.wikipedia.org/wiki/Diameter_(group_theory)) - [H. A. Helfgott and Á. Seress, *On the diameter of permutation groups*](https://arxiv.org/abs/1109.3550) - [L. Babai and Á. Seress, *On the diameter of permutation groups*, European Journal of Combinatorics 13 (1992), 231-243](https://doi.org/10.1016/S0195-6698(05)80029-0) This file contains two conjectures from the Babai-Seress paper: - **Conjecture 1.5**: $\operatorname{diam}(A_n) < n^C$ for some absolute constant C, where A_n is the alternating group on n elements. - **Conjecture 1.7**: $\operatorname{diam}(G) < (\log |G|)^C$ for some absolute constant C, where G ranges over all non-abelian finite simple groups. Conjecture 1.7 generalises Conjecture 1.5, since for $G = A_n$ we have $\log |A_n| \approx n \log n$, so a polylogarithmic bound in $|G|$ implies a polynomial bound in n.

research solved | proof annotation: False | 官方代码 | 原文线索

`HasUniqueExtension` is known to hold for certain triples, including $\{1, 3, 8\}$: this is essentially the Baker-Davenport theorem [BD69], which states that 120 is the only integer d such that $\{1, 3, 8, d\}$ is a Diophantine tuple. Together with a finite check ruling out $d < 8$, this shows that no integral Diophantine tuple properly extends $\{1, 3, 8, 120\}$.

Goldfeld's conjecture ([Goldfeld1979], Conjecture B), in the form stated in the introduction of [Smith2025]: when the quadratic twists E^d of an elliptic curve E over $\mathbb{Q}$ are ordered by $|d|$, 50% of them have rank 0 and 50% have rank 1. See `goldfeld_conjecture.variants.two_le` for the remaining case $2 \leq r$. Goldfeld states the conjecture for the analytic rank of E^d, which the Birch and Swinnerton-Dyer conjecture predicts is equal to the Mordell-Weil rank used here. Corollary 1.2 of [Smith2025] proves that the Birch and Swinnerton-Dyer conjecture for the quadratic twist family of E implies Goldfeld's conjecture for E.

```

research open | proof annotation: False | 官方代码 | 原文线索

[PPVW2016] 8.2(b): for 1 ≤ r ≤ 20, the number of elliptic curves over ℚ with rank at least `r` and naïve height at most `H` is asymptotically `H ^ ((21 - r) / 24 + o(1))`. Note: $\mathcal{E}$_H in 8.2(b) should be $\mathcal{E}$_{≤H}, see the statement of Theorem 7.3.3. When `r = 1`, the exponent is `20 / 24 = 5 / 6`, which agrees with the exponent in `card_heightLE_div_pow_five_div_six_tensto` and is consistent with `half_rank_zero_and_half_rank_one`. The equality is asserted only for large `H`, matching the `o(1)` above: it cannot hold at small `H`, because `heightLE H` is empty for `H ≤ 3` (`naiveHeight E ≤ 3` forces `A = B = 0`, which both `Δ_ne_zero` and `reduced` exclude) and consists only of the two rank-zero curves `y² = x³ ± x` for `4 ≤ H ≤ 26`, while the right hand side is `Real.rpow` and hence strictly positive.

V2-000678 | Falconer's distance set conjecture | falconer_conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

Falconer's distance set conjecture in dimension $d \ge 2$. The hypothesis $2 \le d$ excludes a degenerate case: the conclusion is false for $d = 1$. The base-7 Cantor set $E = \{\sum_{n \ge 1} a_n 7^{-n} : a_n \in \{0, 1, 2\}\}$ is compact with $\dim_H E = \log 3 / \log 7 > 1/2$, but $E - E$ has digits in $\{-2, \dots, 2\}$, so after fixing n digits it is covered by 5^n intervals of length $\frac{2}{3} 7^{-n}$ and is therefore null; its distance set is the image of $E - E$ under $|\cdot|$ and is null too. This was proved by an internal OpenAI model in September 2026 [OAI26a]; see the linked Lean proof.

Goodman's conjecture on coefficients of p-valent functions

MODULE CONTEXT: # Goodman's conjecture on coefficients of p-valent functions A regular (analytic) function is **p-valent** on the unit disk if it assumes each value at most p times there, and some value exactly p times. For such a function $f(z) = \sum_{n \ge 1} b_n z^n$ (so $f(0) = 0$), **Goodman's conjecture** (1948) asserts that its coefficients satisfy $$|b_n| \le \sum_{k=1}^{p} \frac{2k (n+p)!}{(p-k)!\,(p+k)!\,(n-p-1)!\,(n^2-k^2)} |b_k| \qquad (n > p).$$ This generalises the classical coefficient bounds for univalent functions (the case $p = 1$, where the bound reads $|b_n| \le n\,|b_1|$, i.e. $|b_n| \le n$ under the classical normalisation $b_1 = 1$) to p-valent functions. It has been verified in several special cases, including p-valent typically-real functions. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Goodman%27s_conjecture) - Goodman, A. W., *On some determinants related to p-valent functions*, Trans. Amer. Math. Soc. 63 (1948), 175-192.

The Hasse--Weil conjecture for elliptic curves

MODULE CONTEXT: # The Hasse--Weil conjecture for elliptic curves The L-series $L(E, s)$ of an elliptic curve E over a number field converges absolutely on $\operatorname{Re} s > 3/2$ ([Tate1966], p. 416; [Gross2011], Lecture 2, §1). The **Hasse--Weil conjecture** predicts that it has an analytic continuation to the whole complex plane and satisfies a functional equation ([Tate1966], p. 416; [Gross2011], Conjecture 2.7, stated there for the completed L-function). Only the continuation is stated here. Over $\mathbb{Q}$ it follows from the modularity theorem. [Wikipedia] states the conjecture for the Hasse--Weil zeta function and asks only for a meromorphic continuation, which is equivalent to a meromorphic continuation of $L(E, s)$. That weaker form is the one the Birch and Swinnerton-Dyer conjecture rests on, so it is recorded here as well. [Gross2011], Conjecture 2.10 takes it as a hypothesis, and only near $s = 1$. The formulation of the Birch and Swinnerton-Dyer conjecture in `FormalConjectures/Millennium/BSD.lean` instead asserts a global meromorphic continuation, so it implies `exists_hasMeromorphicContinuation` below. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Hasse%E2%80%93Weil_zeta_function#Hasse%E2%80%93Weil_conjecture) - [Tate1966] John Tate. Polynomial-time computability of factoring

MODULE CONTEXT: # Polynomial-time computability of factoring This file formalizes the open problem of whether natural number / integer factorization can be computed in polynomial time on a deterministic classical Turing machine. More precisely, it formalizes the following statement: Can the prime factorization of a natural number be computed in polynomial time (on a deterministic classical Turing machine)? *References:* - [Wikipedia: List of unsolved problems in computer science](https://en.wikipedia.org/wiki/List_of_unsolved_problems_in_computer_science) - [Wikipedia: Integer factorization](https://en.wikipedia.org/wiki/Integer_factorization)

The finite field Kakeya conjecture asserts that any Kakeya set in `𝔽_qⁿ` has size at least `c_n · qⁿ` for some constant `c_n` depending only on `n`. This was first proved by Dvir [Dv08]. The best known bound to date, due to Bukh and Chao [BuCh21], establishes that any Kakeya set in `𝔽_qⁿ` has size at least `qⁿ / (2 - 1/q)^(n - 1)`. The dimension is positive, as in `kakeya_set_conjecture`; for `n = 0` the empty set is a Kakeya set and the bound would read `1 ≤ 0`. [Dv08] Dvir, Z., _On the size of Kakeya sets in finite fields_. Journal of the American Mathematical Society 22 (2009), no. 4, 1093-1097. [BuCh21] Bukh, B. and Chao, T.-W., _Sharp density bounds on the finite field Kakeya problem_. Komlós conjecture

MODULE CONTEXT: # Komlós conjecture The Komlós conjecture in discrepancy theory: there is a universal constant K such that for all n, m and all vectors $v_1, \dots, v_n \in \mathbb{R}^m$ with $\|v_i\|_2 \le 1$, there exist signs $\varepsilon_i \in \{-1, +1\}$ such that $$\left\|\sum_{i=1}^n \varepsilon_i v_i\right\|_\infty \le K.$$ For a long time the best known bound was due to Banaszczyk, who proved that one can always achieve $O(\sqrt{\log n})$. The Beck-Fiala theorem on the discrepancy of sparse set systems is a special case (up to scaling), and the conjecture implies the Beck-Fiala conjecture that set systems of degree t have discrepancy $O(\sqrt{t})$. The conjecture was proved in September 2026 by Guo, Fang and Lu with $K = 3\sqrt{2\pi}$. Karingula and Lovett gave an elementary proof with $K = 36$. A formalisation of their proof is recorded in the `formal_proof` attributes below. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Discrepancy_theory#Major_open_problems) - [W. Local uniformization

MODULE CONTEXT: # Local uniformization Let F be a finitely generated field extension of a field k and let $\mathcal{O}$ be a valuation ring of F containing k. *Local uniformization* asks for an affine model of $F \mid k$ on which the centre of $\mathcal{O}$ is a regular point: a finitely generated k-subalgebra $A \subseteq \mathcal{O}$ with fraction field F such that $A_\mathfrak{p}$ is regular, where $\mathfrak{p} = \mathfrak{m}_\mathcal{O} \cap A$ is the centre. This is the local form of resolution of singularities, one valuation at a time. Zariski introduced it and proved it in characteristic zero, and deduced resolution of singularities in dimension at most three from it. In positive characteristic it is known in dimension at most three, and open from dimension four on. A place is *Abhyankar* when the rational rank of its value group and the transcendence degree of its residue field over k add up to the transcendence degree of $F \mid k$; an Abhyankar place whose residue field is separable over k is uniformized in any dimension [KK2005]. The form asked here is the weak one: some affine model of $F \mid k$ works. The proofs give the strong form, where the model may moreover be required to contain a prescribed finite subset of $\mathcal{O}$, and that is the form that patches into a resolution of singularities. The conclusion here asks that the centre be a regular point, not a smooth one. Over a perfect field the two agree; over an imperfect field regularity is the right condition, since already $k(a^{1/p}) \mid k$ for $a \in k \setminus k^p$ has no model that is smooth over k. For a field extension, `Algebra.EssFiniteType k F` says that F is finitely generated as a field over k, and `Algebra.trdeg k F` is the transcendence degree, the dimension of a model. The centre `ValuationSubring.centerOn` and the predicate `ValuationSubring.HasLocalUniformization` are defined in `FormalConjecturesForMathlib.RingTheory.Valuation.LocalUniformization`. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Local_uniformization) - [Zar1940] O. V2-000718 | Local uniformization | local_uniformization_of_trdeg_le_three

research solved | proof annotation: False | 官方代码 | 原文线索

Local uniformization holds in transcendence degree at most three over any field. In characteristic zero this is [Zar1940]. In positive characteristic, surfaces are [Abh1956]; threefolds over an algebraically closed field of characteristic $p > 5$ are [Abh1966], simplified in [Cut2009]; and the remaining characteristics $2, 3, 5$ are [CP2008] and [CP2009], for quasi-projective threefolds over a field k with $[k : k^p] < \infty$. It follows in the generality stated here from [CP2019], Theorem 1.1, which resolves the singularities of every reduced separated Noetherian quasi-excellent scheme of dimension at most three in any characteristic: the centre of $\mathcal{O}$ on a resolution of a proper model of $F \mid k$ is a regular point.

```
theorem local_uniformization_of_trdeg_le_three (k F : Type*) [Field k] [Field F] [Algebra k F]

V2-000719 | The Lovász-Plummer conjecture (proved 2011) and Sheehan's conjecture | lovasz_plummer_conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

The Lovász-Plummer conjecture (1970s), proved by Esperet, Kardoš, King, Král' and Norine (2011). Every bridgeless cubic graph on n vertices has exponentially many perfect matchings: there is a constant $c > 0$ such that the number of perfect matchings is at least 2^{cn}. [EKKKN11] prove this with $2^{n/3656}$.

```
theorem lovasz_plummer_conjecture :
∃ c : ℝ, 0 < c ∧ ∀ {V : Type} [Fintype V] [DecidableEq V]
(G : SimpleGraph V) [DecidableRel G.Adj],
(∀ v, G.degree v = 3) → G.IsBridgeless →
(2 : ℝ) ^ (c * Fintype.card V) ≤ perfectMatchingCount G
```

V2-000720 | The Lovász-Plummer conjecture (proved 2011) and Sheehan's conjecture | sheehan_conjecture

research open | proof annotation: False | 官方代码 | 原文线索

Sheehan's conjecture (1977). Every 4-regular graph with a Hamiltonian cycle has a second Hamiltonian cycle (one with a different edge set). Sheehan's conjecture would settle the last open case of the question, raised by Smith's theorem for cubic graphs, of which regular Hamiltonian graphs have a second Hamiltonian cycle: Thomassen [Th98] proved it for all r-regular graphs with $r \ge 300$.

```
theorem sheehan_conjecture :
∀ {V : Type} [Fintype V] [DecidableEq V] (G : SimpleGraph V) [DecidableRel G.Adj],
(∀ v, G.degree v = 4) →
∀ (v : V) (c : G.Walk v v), IsHamiltonianCycle G c →
∃ (w : V) (c' : G.Walk w w), IsHamiltonianCycle G c' ∧
c'.edges.toFinset ≠ c.edges.toFinset
```

Conjectures about the Mandelbrot and Multibrot sets

MODULE CONTEXT: # Conjectures about the Mandelbrot and Multibrot sets This file adds three conjectures about the Mandelbrot and Multibrot sets: - the *MLC conjecture*, stating that these sets are locally connected - the *density of hyperbolicity* conjecture, stating that parameters with attracting cycles are dense in the Mandelbrot and Multibrot sets - the conjecture that the boundaries of these sets have zero area. The first two conjectures are related in that the former implies the latter. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Mandelbrot_set#Local_connectivity) - [arxiv/math/9902155](https://arxiv.org/abs/math/9902155) - [mathoverflow/37229](https://mathoverflow.net/questions/37229/)

V2-000721 | Conjectures about the Mandelbrot and Multibrot sets | MLC_general_exponent

research open | proof annotation: False | 官方代码 | 原文线索

A stronger version of the MLC conjecture, stating that all multibrots are locally connected. Note that we don't need to require `2 ≤ n` because the conjecture holds in the trivial cases `n = 0` and `n = 1` too.

```
theorem MLC_general_exponent (n : ℕ) : LocallyConnectedSpace (multibrotSet n)
```

Modularity conjecture

MODULE CONTEXT: # Modularity conjecture The **Modularity conjecture** (also known as the Shimura-Taniyama-Weil conjecture) states that every rational elliptic curve is modular, meaning that it can be associated with a modular form. We state the `a_p` version of the conjecture, which relates the coefficients of the modular form to the number of points on the elliptic curve over finite fields. Since we don't have the conductor of the elliptic curve, our definition of `a_p(E)` differs from that in the literature at primes of bad reduction. For this reason, we state the conjecture with the assumption that `p ∤ N`, in order to give an equivalent statement. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Modularity_theorem) - [F. Diamond and J. Shurman, *A First Course in Modular Forms*](https://doi.org/10.1007/978-0-387-27226-9)

Asymptotic density of powerful numbers

MODULE CONTEXT: # Asymptotic density of powerful numbers Let $Q(x)$ denote the number of powerful integers up to x. Erdős and Szekeres [ES35] proved $$Q(x) = \frac{\zeta(3/2)}{\zeta(3)} x^{1/2} + O(x^{1/3}),$$ and Bateman and Grosswald [BG58] sharpened this to $$Q(x) = \frac{\zeta(3/2)}{\zeta(3)} x^{1/2} + \frac{\zeta(2/3)}{\zeta(2)} x^{1/3} + O(x^{1/6}).$$ Improving the exponent $1/6$ in the error term unconditionally remains open; conditional improvements are known under the Riemann Hypothesis. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Powerful_number) - [ES35] Erdős, P. and Szekeres, G., *Über die Anzahl der Abelschen Gruppen gegebener Ordnung und über ein verwandtes zahlentheoretisches Problem*, Acta Sci. Math. (Szeged) 7 (1935), 95-102. - [BG58] Bateman, P. T. and Grosswald, E., *On a theorem of Erdős and Szekeres*, Illinois J. Math. 2 (1958), 88-98.

Resolution of singularities

MODULE CONTEXT: # Resolution of singularities A variety X over a field k admits a resolution of singularities if there is a smooth k-variety Y and a proper birational morphism $Y \to X$. Hironaka proved that every variety over a field of characteristic zero admits one. In positive characteristic this is known over a perfect field in dimension at most three, and is open from dimension four on. Perfectness of k cannot be dropped from the statement in this form: over an imperfect field it fails already in dimension zero, see `exists_not_hasResolution_of_not_perfectField` below. Over an arbitrary field one asks instead that Y be regular. *References:* * [Wikipedia](https://en.wikipedia.org/wiki/Resolution_of_singularities) * [Hir1964] H. V2-000773 | Resolution of singularities | resolution_of_singularities_of_topologicalKrullDim_le_three

research solved | proof annotation: False | 官方代码 | 原文线索

Resolution of singularities holds in dimension at most three over any perfect field. In characteristic zero this is [Hir1964]. In positive characteristic, dimension at most two is [Lip1978] and dimension three is due to Cossart and Piltant: [CP2008] and [CP2009] prove it for quasi-projective varieties over a field that is differentially finite over a perfect subfield, and [CP2019], Theorem 1.1, removes both restrictions, resolving every reduced separated Noetherian quasi-excellent scheme of dimension at most three in any characteristic. That theorem gives an everywhere regular source, which over a perfect field is the same as a smooth one. The problem is open in positive characteristic from dimension four on.

```
theorem resolution_of_singularities_of_topologicalKrullDim_le_three (k : Type u) [Field k]

(hqa : IsNontrivial q a) (hmax : Q N q a = Qmax N) : q = 24

FC-RudinsConjecture.rudins_conjecture_unique

Sato-Tate conjecture

MODULE CONTEXT: # Sato-Tate conjecture The **Sato-Tate conjecture** describes the distribution of the normalized Frobenius traces $a_p(E)/(2\sqrt{p})$ of a non-CM elliptic curve E over $\mathbb{Q}$, as p ranges over the primes of good reduction: they equidistribute in $[-1,1]$ with respect to the **Sato-Tate measure** $$ \frac{2}{\pi}\sqrt{1-x^2}\,dx. $$ Originally conjectured independently by Mikio Sato and John Tate around 1960, it is now a theorem: the case of elliptic curves over totally real fields with nonintegral j-invariant was established through the work of Clozel, Harris, and Taylor [CHT08], Taylor [Tay08], and Harris, Shepherd-Barron, and Taylor [HST10]. The remaining non-CM case was settled by Barnet-Lamb, Geraghty, Harris, and Taylor [BGHT11]. In particular, it holds unconditionally for every non-CM elliptic curve over $\mathbb{Q}$. We use `ModularityConjecture.WeierstrassCurve.ap`, which agrees with the Frobenius trace at every prime where the supplied Weierstrass equation has integral coefficients and nonsingular reduction. Only finitely many primes are exceptional. Including these primes does not change the limiting density, so the formal statement averages over all primes below N. The non-CM hypothesis is expressed using the classification of rational CM j-invariants. Complex multiplication here means complex multiplication over $\overline{\mathbb{Q}}$. ## References - [CHT08] L. Clozel, M. Harris, R. The Sato-Tate conjecture: for a non-CM elliptic curve E over $\mathbb{Q}$ and $-1 \le a \le b \le 1$, the proportion of primes $p < N$ whose normalized coefficient belongs to $[a,b]$ tends to $$ \frac{2}{\pi}\int_a^b \sqrt{1-x^2}\,dx $$ as $N \to \infty$. The finitely many primes where the supplied equation fails to have integral coefficients and nonsingular reduction do not affect this limit. Established through the work of Clozel-Harris-Taylor [CHT08], Taylor [Tay08], Harris-Shepherd-Barron-Taylor [HST10], and Barnet-Lamb-Geraghty-Harris-Taylor [BGHT11].

Serre's multiplicity conjectures

MODULE CONTEXT: # Serre's multiplicity conjectures Let R be a regular local ring and let M, N be finitely generated R-modules such that $M \otimes_R N$ has finite length. Serre defined the intersection multiplicity $$\chi(M, N) = \sum_{i \ge 0} (-1)^i \ell_R(\operatorname{Tor}_i^R(M, N)).$$ He proved the dimension inequality $\dim M + \dim N \le \dim R$ for every regular local ring, and conjectured the following three properties: - **Non-negativity:** $\chi(M, N) \ge 0$. - **Vanishing:** if $\dim M + \dim N < \dim R$, then $\chi(M, N) = 0$. - **Positivity:** if $\dim M + \dim N = \dim R$, then $\chi(M, N) > 0$. Serre proved all three when R is of equal characteristic, or of mixed characteristic and unramified. Vanishing was proved in general by Roberts and, independently, by Gillet and Soulé. Non-negativity was proved in general by Gabber. Positivity is open in general. For Serre's two special cases, this file states only positivity, since non-negativity and vanishing are now known in general. The intersection multiplicity is `Module.intersectionMultiplicity`, defined in `FormalConjecturesForMathlib.RingTheory.IntersectionMultiplicity`. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Serre%27s_multiplicity_conjectures) - [Se00] J.-P. Case `H = K_2` (single edge): Sidorenko's inequality holds trivially with equality. When `H` is `K_2` (the single-edge graph on 2 vertices), `e(H) = 1`, so the RHS of Sidorenko's inequality is just `t(K_2, G)^1 = t(K_2, G) = t(H, G)`, which equals the LHS. Hence the inequality holds as equality. The proof records that `(completeGraph (Fin 2)).edgeFinset.card = 1` and then reduces the claim to `t(K_2, G) ≤ t(K_2, G)`, which is `le_refl`.

research solved | proof annotation: False | 官方代码 | 原文线索

Case `H = K_{2,2}` (four-cycle, also called `C_4`): Sidorenko's conjecture holds, by Cauchy-Schwarz. The textbook statement at `H = K_{2,2}` is `t(K_2, G)^{e(K_{2,2})} = t(K_2, G)^4 ≤ t(K_{2,2}, G)`. **Proof sketch.** Write `d(a) := G.degree a`. Then - `homCount(K_2, G) = ∑_a d(a) = 2·|E(G)|` (handshaking). - `homCount(K_{2,2}, G) = ∑_{b₀, b₁} |N(b₀) ∩ N(b₁)|²` (product structure of bipartite homomorphism). - `∑_{b₀, b₁} |N(b₀) ∩ N(b₁)| = ∑_a d(a)²` (swap sums). - Cauchy-Schwarz #1: `(∑_{b₀, b₁} |N(b₀) ∩ N(b₁)|)² ≤ |W|² · ∑_{b₀, b₁} |N(b₀) ∩ N(b₁)|²`. - Cauchy-Schwarz #2: `(∑_a d(a))² ≤ |W| · ∑_a d(a)²`. - Chain: `(∑_a d(a))⁴ ≤ |W|⁴ · homCount(K_{2,2}, G)`. - Divide by `|W|^8` to get `t(K_2, G)^4 ≤ t(K_{2,2}, G)`. The proof uses `Finset.sum_mul_sq_le_sq_mul_sq` (discrete Cauchy-Schwarz) from `Mathlib.Algebra.Order.BigOperators.Ring.Finset`. **Status (2026-04-22):** main theorem closed sorry-free. See [Si93].

Sidorenko's conjecture (1993). For every finite bipartite simple graph H and every finite simple graph G: $t(H, G) \ge t(K_2, G)^{e(H)}$, where K_2 denotes the single-edge graph on 2 vertices (i.e. `completeGraph (Fin 2)`). This is false. It was disproved by an internal OpenAI model in September 2026 [OAI26a]; see the linked Lean proof, which gives a bipartite H with 35 vertices and 66 edges and a finite host G with $t(H, G) < t(K_2, G)^{66}$.

V2-000799 | Sidorenko's conjecture (1993) | sidorenko_conjecture_graphon

research solved | proof annotation: False | 官方代码 | 原文线索

Sidorenko's conjecture for graphons (1993). For every finite bipartite simple graph H and every graphon W on $[0, 1]$ with Lebesgue measure: $t(H, W) \ge t(K_2, W)^{e(H)}$, where $t(K_2, W) = p(W)$ is the edge density of W, and $t(H, W)$ is the graphon homomorphism density of H in W. This is false. The finite counterexample of [OAI26a] (see `sidorenko_conjecture`) also refutes the graphon form: the step graphon of the finite host graph has the same homomorphism densities and the same edge density as the host. This reduction is not part of the linked Lean proof of the finite form.

```
theorem sidorenko_conjecture_graphon :

research solved | proof annotation: False | 官方代码 | 原文线索

Case: `H` is a tree (Sidorenko 1993). If `H` is a finite tree then Sidorenko's inequality holds. **Proof idea (Sidorenko 1993):** by induction on the tree, applying Jensen / convexity. The number of homomorphisms from a tree `T` with `v` vertices and `v - 1` edges into `G` factors nicely in the degree sequence of `G`, and AM-GM / convexity gives the required lower bound. **Current status (2026-04-22, partial):** - The subsingleton base case (`|V(T)| ≤ 1`) is dispatched via `sidorenko_tree_subsingleton`. - The main inductive step (leaf extraction + AM-GM on the degree sequence) is deferred; it requires a walk-parametrised homomorphism count for trees and a discrete Jensen inequality. See [Si93]. The full proof is left as `sorry`; the subsingleton case is closed.

```

Sierpiński number

MODULE CONTEXT: # Sierpiński number *References:* - [Wikipedia, Sierpiński number](https://en.wikipedia.org/wiki/Sierpi%C5%84ski_number) - [Si60] Sierpiński, W., Elementary Theory of Numbers. Państwowe Wydawnictwo Naukowe, Warsaw (1960). A positive odd integer k is a *Sierpiński number* if $k \cdot 2^n + 1$ is composite for all natural numbers n. In 1960, Sierpiński proved that there are infinitely many such numbers. John Selfridge proved in 1962 that 78557 is a Sierpiński number. It is conjectured to be the smallest. ## Sierpiński problem The *Sierpiński problem* asks: is 78557 the smallest Sierpiński number? ## Prime Sierpiński problem The *prime Sierpiński problem* asks: is 271129 the smallest *prime* Sierpiński number? ## Extended Sierpiński problem The *extended Sierpiński problem* asks: is 271129 the second-smallest Sierpiński number?

V2-000808 | Sierpiński number | extended_sierpinski_problem

research open | proof annotation: False | 官方代码 | 原文线索

The extended Sierpiński problem. Is 271129 the second-smallest Sierpiński number? Even if 78557 is confirmed as the smallest Sierpiński number, there could exist a composite Sierpiński number k with $78557 < k < 271129$. We formalize "second-smallest" as: the least Sierpiński number k such that there exists exactly one Sierpiński number below it.

```
theorem extended_sierpinski_problem :
IsLeast {k | k.IsSierpinskiNumber ∧
∃ k', k'.IsSierpinskiNumber ∧ k' < k} 271129
```

Six standard deviations suffice (Spencer's theorem)

MODULE CONTEXT: # Six standard deviations suffice (Spencer's theorem) Spencer's theorem in discrepancy theory: for every n and every family of n subsets $S_1, \dots, S_n$ of $\{1, \dots, n\}$, there is a colouring $\chi : \{1, \dots, n\} \to \{-1, +1\}$ such that $$\left|\sum_{j \in S_i} \chi(j)\right| \le 6\sqrt{n}$$ for every i. A uniformly random colouring only achieves the bound $O(\sqrt{n \log n})$, so Spencer's theorem ("six standard deviations suffice") is a genuine improvement over the basic probabilistic method; its proof uses a partial-colouring argument based on the entropy method, and the bound $\Theta(\sqrt{n})$ is tight up to the value of the constant. Spencer's original argument is non-constructive; polynomial-time algorithms achieving $O(\sqrt{n})$ were later found by Bansal (2010) and Lovett-Meka (2012). The Komlós conjecture (the subject of a companion file in this directory) would strengthen this theorem: applied to the incidence vectors of the sets, scaled by $1/\sqrt{n}$, it would give a discrepancy bound $O(\sqrt{n})$ for any number of sets, not just n of them. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Discrepancy_of_hypergraphs#General_hypergraphs) - [J. Spencer, *Six standard deviations suffice*, Trans. Amer. Math. Soc. **289** (1985), 679-706](https://doi.org/10.1090/S0002-9947-1985-0784009-0) - [N. The small Cohen-Macaulay modules conjecture

MODULE CONTEXT: # The small Cohen-Macaulay modules conjecture Let $(R, \mathfrak m)$ be a Noetherian local ring of Krull dimension d. A *system of parameters* of R is a sequence $x_1, \dots, x_d$ of d elements of R with $\sqrt{(x_1, \dots, x_d)} = \mathfrak m$, equivalently with $R / (x_1, \dots, x_d)$ Artinian. A *small Cohen-Macaulay module*, also called a maximal Cohen-Macaulay module, is a finitely generated R-module $M \ne 0$ such that some system of parameters of R is a regular sequence on M. A *balanced big Cohen-Macaulay module* is a module W, not necessarily finitely generated, with $\mathfrak m W \ne W$ and on which every system of parameters is a regular sequence. For finitely generated modules the two notions agree. **Small Cohen-Macaulay modules conjecture.** If R is complete, then R has a small Cohen-Macaulay module. Hochster conjectured this for complete local domains in the early 1970s. In the 2000s he conjectured the opposite, that there are complete local domains with no small Cohen-Macaulay module [Ho17]. Small Cohen-Macaulay modules are known to exist when $\dim R \le 2$, and when R is $\mathbb N$-graded over a perfect field of characteristic p with an isolated non-Cohen-Macaulay point at the origin, a case first observed by Hartshorne and rediscovered by Peskine and Szpiro [Ho75b]. In dimension at least three the conjecture is open in every characteristic, although classes of examples keep being found there, such as three-dimensional F-pure complete local $\mathbb F_p$-algebras, due to Schoutens, and three-dimensional completions of $\mathbb N$-graded rings over a field of characteristic p, due to Hochster; both are listed, with references, in [ST23]. The analogous statement for algebras is false: Bhatt constructed complete local normal domains of characteristic p admitting no module-finite extension ring that is Cohen-Macaulay [Bh14]. Balanced big Cohen-Macaulay modules, by contrast, are now known to exist over every Noetherian local ring, by Hochster in equal characteristic and by André in mixed characteristic. Systems of parameters and Cohen-Macaulay modules are defined in `FormalConjecturesForMathlib.RingTheory.SystemOfParameters` and `FormalConjecturesForMathlib.RingTheory.CohenMacaulayModule`. *References:* - [Wikipedia, Homological conjectures in commutative algebra](https://en.wikipedia.org/wiki/Homological_conjectures_in_commutative_algebra), conjectures 8 and 14. - [Ho75a] M. The small Cohen-Macaulay modules conjecture. If R is a complete Noetherian local ring, then there is a finitely generated R-module $M \ne 0$ such that some system of parameters of R is a regular sequence on M. Hochster stated the conjecture for complete local domains [Ho17, Conjecture 2.1]. The two forms are equivalent: for a minimal prime P of R with $\dim R/P = \dim R$, a small Cohen-Macaulay module over the complete local domain R/P is one over R. In the 2000s Hochster conjectured the opposite, that some complete local domain has no small Cohen-Macaulay module [Ho17, Conjecture 2.2], so this statement may well be false.

```
theorem exists_isSmallCohenMacaulay [IsAdicComplete (maximalIdeal R) R] :
∃ (M : Type u) (_ : AddCommGroup M) (_ : Module R M), IsSmallCohenMacaulay R M

```

FC-SolitaryNumber.infinite_club_exists

Sparse Ruler

MODULE CONTEXT: # Sparse Ruler A sparse ruler of length L is a sequence of marks $0 = a_1 < a_2 < \dots < a_m = L$. A distance $k \in \mathbb{N}$ can be measured if there are $i, j \in \{1, \dots, m\}$, such that $k = a_j - a_i$. One question concerns the structure of *optimal* rulers. Wichmann [Wi63] gave a parametric family of sparse rulers and speculated that every sufficiently large optimal ruler is of his type. The Wikipedia article records that no optimal ruler of length $1, 13, 17, 23$ or 58 is a Wichmann ruler, and that every other optimal length up to 213 is attained by one; non-Wichmann optimal rulers also occur alongside Wichmann ones at lengths $9, 29, 50$ and 68. The asymptotic growth of the minimal number of marks of an optimal ruler of length L - i.e. the limit of $l(n)^2 / n$, conjectured to lie in $[2.434\ldots, 3]$ - is the subject of `FormalConjectures.ErdosProblems.«170»` (there phrased via $F(N)/\sqrt{N}$), and is not restated here. *References:* - [Wi63] Wichmann, B. "A note on restricted difference bases." Journal of the London Mathematical Society 38 (1963): 465-466. - [Wikipedia](https://en.wikipedia.org/wiki/Sparse_ruler)

V2-000817 | Sparse Ruler | wichmann_conjecture

research open | proof annotation: False | 官方代码 | 原文线索

Wichmann's conjecture on optimal rulers. Every optimal ruler of sufficiently large length is a Wichmann ruler $W(r, s)$ (up to reflection, i.e. reversing the segment list). Posed by Wichmann [Wi63]. The Wikipedia article records that no optimal ruler of length $1, 13, 17, 23$ or 58 is a Wichmann ruler, and that every other optimal length up to 213 is attained by one; non-Wichmann optimal rulers also occur alongside Wichmann ones at lengths $9, 29, 50$ and 68.

```
theorem wichmann_conjecture :

Polynomial-time computability of comparisons of sums of square roots

MODULE CONTEXT: # Polynomial-time computability of comparisons of sums of square roots This file formalizes the "Square-root sum problem" which asks if one can decide in polynomial time on a Turing machine whether the sum of the square roots of a list of naturals is at most a cutoff (or alternatively, at most another such sum). This problem is relevant to questions in computational geometry (for example, in determining which of two polygonal paths in Euclidean space is longer). Wikipedia states the problem for positive integers, an integer threshold, and lists of equal length. The versions here allow zeros, a natural-number threshold, and lists of any length. This slightly more general formulation can be reduced to the fixed length form (by removing zeros and introducing copies of $\sqrt{4}$ to the longer list and $\sqrt{1} + \sqrt{1}$ to the shorter one). *References:* - [Wikipedia: List of unsolved problems in computer science](https://en.wikipedia.org/wiki/List_of_unsolved_problems_in_computer_science) - [Wikipedia: Square-root sum problem](https://en.wikipedia.org/wiki/Square-root_sum_problem)

Steiner Systems

MODULE CONTEXT: # Steiner Systems A Steiner system $S(t, k, n)$ is a collection of k-element subsets (called blocks) of an n-element set such that every t-element subset is contained in exactly one block. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Steiner_system) - [Large Steiner Systems](https://epoch.ai/frontiermath/open-problems/large-steiner-systems) by Kunal Marwaha

V2-000825 | Steiner Systems | infinitely_many_steiner_t4

research solved | proof annotation: False | 官方代码 | 原文线索

There are infinitely many Steiner systems with $t = 4$. Keevash (2014) proved that for any fixed t and k, a Steiner system $S(t, k, n)$ exists for all sufficiently large n satisfying the necessary divisibility conditions. Since there are infinitely many such admissible n, this implies infinitely many $S(4, k, n)$ systems exist (for any fixed $k > 4$). The proof is nonconstructive. Explicit examples include $S(4, 5, 11)$ (the unique system, related to the Mathieu group M_{11}) and $S(4, 7, 23)$ (related to the Mathieu group M_{23}). Only nontrivial systems with $4 < k < n$ are counted: for every n the single block $\{1, \dots, n\}$ is an $S(4, n, n)$, and all 4-subsets of an n-set form an $S(4, 4, n)$.

theorem infinitely_many_steiner_t4 :
{s : Σ k n : ℕ, S(4, k, n) | 4 < s.1 ∧ s.1 < s.2.1}.Infinite

FC-SteinerSystems.infinitely_many_steiner_t4

research solved | proof annotation: False | 官方代码 | 原文线索

There are infinitely many Steiner systems with $t = 5$. Keevash (2014) proved that for any fixed t and k, a Steiner system $S(t, k, n)$ exists for all sufficiently large n satisfying the necessary divisibility conditions. This settles the long-standing open problem of whether infinitely many $S(5, k, n)$ systems exist. The proof is nonconstructive. Only two explicit examples are known: $S(5, 6, 12)$ and $S(5, 8, 24)$, both Witt designs related to the Mathieu groups M_{12} and M_{24} respectively. Only nontrivial systems with $5 < k < n$ are counted, for the same reason as in `infinitely_many_steiner_t4`. No Steiner system with $t \geq 6$ has been explicitly constructed, though Keevash's result guarantees their existence nonconstructively as well.

theorem infinitely_many_steiner_t5 :

Gottschalk's surjunctivity conjecture

MODULE CONTEXT: # Gottschalk's surjunctivity conjecture A group G is *surjunctive* if every injective, continuous, G-equivariant map $A^G \to A^G$ (for any finite alphabet A) is surjective. Here equivariance is with respect to the left shift action of G on A^G, defined by $(g \cdot x)(h) = x(g^{-1} h)$, and continuity is with respect to the product topology on A^G (where A carries the discrete topology). Gottschalk's conjecture (1973) states that every group is surjunctive. It is false: an internal OpenAI model gave counterexamples in September 2026 [OAI26a], [OAI26b]. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Surjunctive_group) - Gottschalk, W. H. (1973), "Some general dynamical notions" - [OAI26a] OpenAI, *A Counterexample to Kaplansky's Direct-Finiteness Conjecture in Characteristic Two*. V2-000833 | Gottschalk's surjunctivity conjecture | counter_gottschalk_surjunctivity

research solved | proof annotation: True | 官方代码 | 原文线索

Gottschalk's surjunctivity conjecture is false: there is a group that is not surjunctive. There are a finite field K, a group G and $a, b \in K[G]$ with $ab = 1$ and $ba \neq 1$. The linear cellular automaton $x \mapsto (g \mapsto \sum_u b_u x(gu))$ on K^G is then injective but not surjective. In [OAI26a], K has characteristic two and G is finitely presented. In [OAI26b], K has odd characteristic and G is finitely generated. This was proved by an internal OpenAI model in September 2026. The linked Lean proof is for [OAI26b]. It shows that the map above is injective and not surjective. That the map is continuous and shift-equivariant, as `IsSurjunctive` requires, is not part of the linked proof.

```
theorem counter_gottschalk_surjunctivity :
∃ (G : Type) (_ : Group G), ¬ IsSurjunctive G
```

FC-GottschalkSurjunctivity.counter_gottschalk_surjunctivity

V2-000834 | Gottschalk's surjunctivity conjecture | gottschalk_surjunctivity_conjecture

research solved | proof annotation: True | 官方代码 | 原文线索

Gottschalk's surjunctivity conjecture (1973): every group is surjunctive. That is, for every group `G` and every finite alphabet `A`, every injective cellular automaton on `A^G` is surjective. This is false. It was disproved by an internal OpenAI model in September 2026 [OAI26a], [OAI26b]; see `counter_gottschalk_surjunctivity` for the counterexample and for what the linked Lean proof covers.

```
theorem gottschalk_surjunctivity_conjecture :
¬ ∀ (G : Type) [Group G], IsSurjunctive G
```

Taxicab numbers

MODULE CONTEXT: # Taxicab numbers A *taxicab number* for natural numbers k, m, n is the smallest number x that can be expressed as a sum of m positive k-th powers in at least n distinct ways. The most famous taxicab number is $ 1729 = 1³ + 12³ = 9³ + 10³, $ also known as the Hardy-Ramanujan number. However, a taxicab number is not known for $k=5$, $m=2$, and any $n ≥ 2$: No positive integer is known that can be written as the sum of two 5th powers in more than one way, and it is not known whether such a number exists. In particular, it is not known whether there exists a taxicab number for $k=5$, $m=2$, and $n=2$. *References:* - [Wikipedia](https://en.wikipedia.org/wiki/Taxicab_number) - [Generalized taxicab number](https://en.wikipedia.org/wiki/Generalized_taxicab_number) - [OEIS taxicab cubes](https://oeis.org/A001235) - [OEIS taxicab 4th powers](https://oeis.org/A018786) - [OEIS taxicab conjecture](https://oeis.org/A088703)

Let K be a real quadratic field of discriminant D and let ε be a fundamental unit of K. Following [EJ10, Remark 2.2.8], an odd prime $p \nmid D$ is a Wall-Sun-Sun prime for K if, in $\mathcal{O}_K$, $\varepsilon^{p-1} \equiv 1 \pmod{p^2}$ when $\left(\tfrac{D}{p}\right) = 1$, and $\varepsilon^{2p+2} \equiv 1 \pmod{p^2}$ when $\left(\tfrac{D}{p}\right) = -1$. Both exponents are even, so the condition does not depend on the choice of ε, and it is equivalent to asking the same congruence for every unit of K. For $K = \mathbb{Q}(\sqrt{5})$ and $\varepsilon = \frac{1 + \sqrt{5}}{2}$ these are the classical Wall-Sun-Sun primes other than 2 and 5 [EJ10, Proposition 2.2.6]. It is conjectured that for every fundamental discriminant $D \neq 1$ there are infinitely many Wall-Sun-Sun primes with discriminant D (Wikipedia; [EJ10, §4.1] gives the heuristic for $\mathbb{Q}(\sqrt{5})$). It is stated here for $D > 0$ only. Wikipedia's sentence also covers $D < 0$, but [EJ10] gives the definition above only for real quadratic fields, and its literal extension to imaginary quadratic fields is degenerate: there every unit is a root of unity of order dividing 4 or 6, and that order divides the relevant exponent $p - 1$ or $2p + 2$ for every odd prime $p \nmid D$.

theorem infinite_isWallSunSunPrime_of_disc_eq {K : Type*} [Field K] [NumberField K] [IsQuadraticExtension ℚ K] [IsTotallyReal K] {D : ℤ} (hD : discr K = D) : {p : ℕ | p.Prime ∧ Odd p ∧ ¬ (p : ℤ) | D ∧ ∀ ε : (𝓞 K)ˣ, (p : 𝓞 K) ^ 2 | (ε : 𝓞 K) ^ (if J(D | p) = 1 then p - 1 else 2 * p + 2) - 1}.Infinite

WOWII [Conjecture 1](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph `G` the maximum number of leaves of a spanning tree satisfies `Ls(G) ≥ n(G) + 1 - 2·m(G)` where `n(G)` counts vertices and `m(G)` is the size of a maximum matching. A formal proof reduces to a spanning tree `T`. If `I` is the set of non-leaves of `T`, Hall's theorem applied to a bipartition of `T` gives a matching `M` with `|I| + 1 ≤ 2 * |M|`. Since `|V|` is the sum of the numbers of leaves and non-leaves, and every matching and leaf count constructed in `T` is admissible for the corresponding supremum in `G`, the stated inequality follows.

Written on the Wall II - Conjecture 100

MODULE CONTEXT: # Written on the Wall II - Conjecture 100 **Verbatim statement (WOWII #100, status O):** > If G is a simple connected graph, then α(G) ≤ CEIL[(maximum of λ(v) + 0.5*length(G̅))/2] **Source:** http://cms.uhd.edu/faculty/delavinae/research/wowII/all.html#conj100 The WOWII HTML uses `length(G̅)` (the bar denotes graph complement); the extracted JSON in our private repo previously dropped the overline. The formal statement below uses the Euclidean norm of the degree sequence of `Gᶜ`. *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Definition of graph length The WOWII definitions popup defines `length(H)` as the square root of the sum of the squares of the vertex degrees. This is `degreeL2Norm H` in Lean. Combined with the overline above, the inequality reads: `α(G) ≤ ⌈(max_v l(v) + 0.5 · degreeL2Norm(Gᶜ)) / 2⌉` where `l(v) = indepNeighbors G v`.

V2-000865 | Written on the Wall II - Conjecture 100 | conjecture100

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 100](http://cms.uhd.edu/faculty/delavinae/research/wowII/all.html#conj100) (status O): For a simple connected graph `G`, `α(G) ≤ ⌈(max_v l(v) + 0.5 · degreeL2Norm(Gᶜ)) / 2⌉` where `α(G) = G.indepNum` is the independence number, `max_v l(v)` is the maximum over all vertices of the independence number of the neighbourhood (in `G`), and `degreeL2Norm(Gᶜ)` is the square root of the sum of the squares of the degrees in the complement `Gᶜ`. **Proof outline.** Choose a maximum independent set `S`, write `A = |S|`, let `T` be its complement, and let `L` be the maximum neighbourhood independence number. Connectedness gives at least one edge from every vertex of `S` into `T`, while each vertex of `T` has at most `L` neighbours in `S`; double counting therefore gives `A ≤ |T|L`. In the complement graph, `S` is a clique. The missing cross-edges force explicit lower bounds on the complement degrees of vertices in both `S` and `T`. Summing their squares gives a lower bound for `degreeL2Norm(Gᶜ)²`, and the resulting quadratic inequality rearranges to the stated ceiling bound. **Provenance.** Solved by Dominic Dabish. ProofOrchestrator, using OpenAI GPT-5.6 Thinking, assisted with the mathematical argument and Lean formalization; all formal claims were checked by the pinned Lean compiler.

WOWII [Conjecture 109](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, the independence number $\alpha(G)$ was conjectured to satisfy $\alpha(G) \le \lfloor (\mathrm{residue}(G) + 2 \cdot b(G)) / 3 \rfloor$, where $\mathrm{residue}(G)$ is the Havel--Hakimi residue and $b(G)$ is the size of a largest induced bipartite subgraph. This is false. A connected graph on 21 vertices has an independent set of size 15, residue 8, and no induced bipartite subgraph with more than 18 vertices, so the conjectured right-hand side is at most 14. A smaller counterexample is the connected 13-vertex graph $\overline{K_7 \vee (K_3 \sqcup K_3)}$. It has independence number 7, residue 2, and largest induced bipartite subgraph size 9, so its conjectured right-hand side is 6.

theorem conjecture109 :

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 142](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/): For a simple connected graph G, $\mathrm{tree}(G) \ge (2/3) \cdot \mathrm{girth}(G) + \mathrm{ecc}(B)$ where $\mathrm{tree}(G)$ is the largest induced tree size, $\mathrm{girth}(G)$ is the length of the shortest cycle (0 if acyclic), B is the set of boundary vertices (those of maximum eccentricity), and $\mathrm{ecc}(B)$ is the eccentricity of the set B. **Proof sketch.** The proof first strengthens the real-valued target to the integral bound $$ \mathrm{ecc}(B) + \mathrm{girth}(G) - \lfloor \mathrm{girth}(G) / 3 \rfloor \leq \mathrm{tree}(G). $$ For a cyclic graph, start with a shortest cycle K. It is chordless, so removing one vertex leaves an induced path on $\mathrm{girth}(G)-1$ vertices. Shortest paths from selected vertices to K are called *descents*. Pairwise noninteracting descents attach to the retained cycle path as disjoint branches. If two descents interact, the proof cuts at the first interaction encountered from the outer endpoint toward the cycle and splices the paths there. Minimality of that interaction makes the retained prefix disjoint and nonadjacent to the first descent; geodesicity excludes chords, while girth at least five rules out extra cross-edges and cycle attachments. Choose a vertex realizing $\mathrm{ecc}(B)$ and two endpoints of a diametral geodesic. Either two of their descents interact, directly giving a sufficiently long spliced tree, or all three are separate, in which case a three-point distance inequality forces their total length to be large enough. This proves the integral bound in the main range. Girths three and four, small $\mathrm{ecc}(B)$, and the two remaining congruence cases are handled by separate geodesic/cycle certificates with one or two descents; the acyclic case follows from a diametral path. Finally, $$ \mathrm{girth}(G)-\lfloor\mathrm{girth}(G)/3\rfloor = \lceil 2\,\mathrm{girth}(G)/3\rceil \geq 2\,\mathrm{girth}(G)/3, $$ which gives the stated real-valued inequality. The argument was developed with assistance from ChatGPT Pro. The linked Lean 4 formalization was produced with assistance from OpenAI Codex and checked by Lean.

research solved | proof annotation: False | 官方代码 | 原文线索

WOWII [Conjecture 143](http://cms.uhd.edu/faculty/delavinae/research/wowII/all.html#conj143): For a simple connected graph G, $\mathrm{tree}(G) \ge (\mathrm{girth}(G) + 1) / \sigma(G)$, where $\mathrm{tree}(G)$ is the largest induced tree size, $\mathrm{girth}(G)$ is the length of the shortest cycle, and $\sigma(G) = G.\mathrm{secondSmallestDegree}$ is the **second-smallest degree** of G's degree sequence (per WOWII defEntry 65). We state the inequality in denominator-free form to avoid the $\sigma = 0$ corner case ($n \le 1$). The proof splits into the acyclic case and two cyclic cases. For an acyclic graph the girth is zero. If $\sigma \ge 2$, deleting two consecutive edges from a shortest cycle leaves an induced tree on $\mathrm{girth}(G)-1$ vertices, and the factor $\sigma \ge 2$ yields the required inequality. If $\sigma = 1$, there are two degree-one vertices. A maximal induced tree containing them must have an external vertex with two attachments; those attachments create a cycle whose length forces the tree to contain at least $\mathrm{girth}(G)+1$ vertices.

WOWII [Conjecture 144](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $\mathrm{tree}(G) \ge \mathrm{girth}(G) - 1 + \mathrm{ecc}(\mathrm{Centers})$ where $\mathrm{tree}(G)$ is the largest induced tree size, $\mathrm{girth}(G)$ is the length of the shortest cycle (0 if acyclic), $\mathrm{Centers} = G.\mathrm{center}$ is the set of vertices with minimum eccentricity (the center of G), and $\mathrm{ecc}(\mathrm{Centers})$ is the eccentricity of the center set - the maximum distance from any non-center vertex to the nearest center vertex. **Proof sketch.** Let $g = \mathrm{girth}(G)$ and $e = \mathrm{ecc}(G, \mathrm{center}(G))$. The acyclic and $e = 0$ cases are immediate. If $g \le e + 2$, the formalized Bacsó--Tuza induced-path argument, with an elementary $e = 1$ case, produces an induced tree on at least $2e + 1$ vertices. Since $g - 1 + e \le 2e + 1$, this proves the result. Suppose instead that $e + 3 \le g$, and fix a shortest cycle C. Removing one vertex of C leaves an induced tree on $g - 1$ vertices. Analyze the connected components outside C. If one has at least e vertices, it supplies an attached rooted induced tree of order e. Otherwise, let D be the sum of the components' attachment depths. If $D \ge e$, select pairwise edge-separated rooted branches of total order e and attach them to C, deleting a suitable cycle vertex. If $D < e$, shortest-cycle contact restrictions bound corresponding exclusion arcs. Their complement consists of central cycle vertices and D-dominates the graph, forcing $e \le D$, a contradiction. Finite graph search was used only during discovery to test candidate structural lemmas and reject false proof templates; no finite-search result is used in the universal proof.

```

Written on the Wall II - Conjecture 145

MODULE CONTEXT: # Written on the Wall II - Conjecture 145 The WOWII HTML uses $\lambda_{\min}(\overline{G})$ (the bar denotes graph complement). The formal statement below uses the local-independence minimum of G^c. *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Definitions The **local independence minimum** $\mathrm{lMin}(G)$ is: $$\mathrm{lMin}(G) = \min_{v \in V(G)} l(v)$$ where $l(v) = \mathrm{indepNeighborsCard}(G, v)$ is the independence number of the neighbourhood of v. This is the minimum over all vertices of the local independence number. The **boundary vertices** $B(G)$ of a connected graph are the vertices v such that the eccentricity of v equals the diameter of G. The **eccentricity of a set** $\mathrm{ecc}(S) = \max_{u \notin S} \min_{w \in S} \mathrm{dist}(u, w)$. In the conjecture below, $\mathrm{ecc}(B)$ is the eccentricity of the boundary set. **Conjecture 145:** $\mathrm{tree}(G) \ge 2 \cdot \mathrm{ecc}(B) / \lambda_{\min}(\overline{G})$ where $\mathrm{tree}(G)$ is `largestInducedTreeSize G`, $\mathrm{ecc}(B)$ is the eccentricity of the boundary vertices, and $\lambda_{\min}(\overline{G})$ is the local independence minimum of the complement $\overline{G}$.

Written on the Wall II - Conjecture 146

MODULE CONTEXT: # Written on the Wall II - Conjecture 146 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Definitions The **square** of a graph G, denoted G^2, is the graph on the same vertex set where two distinct vertices are adjacent if and only if their distance in G is at most 2. The **radius of G^2** is the minimum eccentricity of any vertex in G^2, i.e., $$\mathrm{rad}(G^2) = \min_{v \in V} \max_{u \in V} \mathrm{dist}_{G^2}(u, v).$$

V2-000876 | Written on the Wall II - Conjecture 146 | conjecture146

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 146](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $\mathrm{tree}(G) \ge 2 \cdot \mathrm{ecc}(B) / \mathrm{rad}(G^2)$ where $\mathrm{tree}(G)$ is the number of vertices in a largest induced subtree, $\mathrm{ecc}(B)$ is the eccentricity of the boundary vertices of G (`eccSet` and `maxEccentricityVertices`), and $\mathrm{rad}(G^2)$ is the radius of the square graph of G. We state the inequality in the form $\mathrm{tree}(G) \cdot \mathrm{rad}(G^2) \ge 2 \cdot \mathrm{ecc}(B)$ to avoid division. ## Informal proof Write t for the largest induced-tree order, r and d for the radius and diameter of G, and p for the eccentricity of its peripheral set. First, the distance in the graph square is $\operatorname{dist}_{G^2}(u,v)=\lceil\operatorname{dist}_G(u,v)/2\rceil$, so $\operatorname{rad}(G^2)=\lceil r/2\rceil$. A diametral geodesic is an induced path, giving $t\ge d+1$, while $p\le d-1$. These bounds settle every case except $r=2$, $d=4$, and $p=3$. In that remaining configuration, choose a centre and shortest paths to two diametral vertices and to a vertex at distance three from the peripheral set. A finite case analysis on the two possible cross-arm edges (and then the possible chords) always produces an induced tree on at least six vertices. Hence $t\,\operatorname{rad}(G^2) \ge 2p$ in the exceptional case as well.

Written on the Wall II - Conjecture 194

MODULE CONTEXT: # Written on the Wall II - Conjecture 194 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Counterexample The conjecture is false. Take a clique on vertices `0, ..., 10`, four additional vertices `11, ..., 14` adjacent to every clique vertex, and three leaves attached at `11`, `12`, and `14`. This connected graph has independence number `4`, while the sum of the independence numbers of its vertex neighbourhoods is `54`, so their average is `3`. Thus it satisfies the conjecture's hypothesis with equality. However, its three leaves would all have to be endpoints of a Hamiltonian path, which is impossible.

WOWII [Conjecture 2](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $Ls(G) \ge 2 \cdot (I(G) - 1)$ where $I(G)$ is the average independence number of the neighbourhoods of the vertices of G. A formal proof has been found with the methods described in [arxiv/2605.22763](https://arxiv.org/abs/2605.22763), where an informal proof is also provided. Another formal proof combines a spanning-tree leaf bound from connected domination with an ordered-pair double-counting argument for adjacent neighbourhoods. A third formal proof starts from a triangle-free spanning subgraph of G with the maximum number of edges. Maximality bounds the neighbourhood independence number of each vertex by its degree in that subgraph; an edge whose endpoint degrees sum to at least $2 \cdot I(G)$ then carries a double star, which is acyclic and extends to a spanning tree with at least $2 \cdot (I(G) - 1)$ leaves.

Written on the Wall II - Conjecture 200

MODULE CONTEXT: # Written on the Wall II - Conjecture 200 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Counterexample For every integer $q \geq 5$, let $C = \{a,b\} \cup D$ have q vertices and induce K_q minus the edge ab. Add two nonadjacent vertices x,y, each complete to C; a vertex z adjacent exactly to a,b; and, for every $d \in D$, a pendant vertex p_d adjacent exactly to d. The local-neighbourhood independence numbers are 2 at x,y,z, 1 at each p_d, and 3 at every vertex of C. Their sum is $4q+4$, while the graph has $2q+1$ vertices, so $$\left\lceil 1 + l_{\mathrm{avg}}(G)\right\rceil = 4.$$ The vertices $\{a,x,y,z\}$ induce a claw, and a case split on the number of vertices from C shows that no induced tree has more than four vertices. Thus $\operatorname{tree}(G)=4$. Finally, the graph has $q-2 \geq 3$ pendant vertices, but a Hamiltonian path has only two endpoints. The smallest member of this family has 11 vertices and graph6 encoding `J??FFBRq}N_`. This is a smallest counterexample overall: an exhaustive search over all 11,989,760 connected graphs on 4 ≤ n ≤ 10 vertices (via nauty's `geng`; graphs on at most 3 vertices are trivially traceable) found no graph satisfying the premise without a Hamiltonian path.

WOWII [Conjecture 200](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph `G`, if `tree(G) = ⌈1 + l_avg(G)⌉`, then `G` has a Hamiltonian path. Here `tree(G)` is the number of vertices of a largest induced tree subgraph, and `l_avg(G) = averageIndepNeighbors G` is the average over all vertices of the independence number of the neighbourhood. A Hamiltonian path is a walk visiting every vertex exactly once. This conjecture is false. The counterexample family in the module docstring satisfies the equality hypothesis and has no Hamiltonian path.

Written on the Wall II - Conjecture 291

MODULE CONTEXT: # Written on the Wall II - Conjecture 291 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Definitions For a vertex v in a graph G, **$T(v)$** is the number of triangles (3-cliques) incident to v, i.e., the number of 3-element cliques in G that contain v. The **triangle-frequency of the minimum** is the number of vertices that achieve the minimum value of $T(v)$. **k** is the **first step in the Havel-Hakimi process at which a zero appears**. Concretely, starting from the descending degree sequence s_0 of G, we set $s_{i+1} = \mathrm{havelHakimiStep}\, s_i$ and let k be the least $i \ge 0$ such that s_i contains a zero entry (or, vacuously, has been emptied entirely). Since each step is sorted descending and never increases entries, this is equivalent to the last (smallest) entry of s_i being 0, or s_i being $[]$. This is **strictly weaker** than $n - \mathrm{residue}(G)$: $n - \mathrm{residue}(G)$ is the *total* number of reduction steps until *every* entry is zero, whereas k only requires that *some* entry has hit zero - and a 0 typically appears well before the all-zero state is reached. **Conjecture 291:** For a simple connected graph G with $n > 2$, $\gamma_t(G) \le k + \mathrm{frequency}(t_{\min}(v))$ where $\gamma_t(G)$ is the total domination number, k is the Havel-Hakimi zero step, and $\mathrm{frequency}(t_{\min}(v))$ is the number of vertices achieving the minimum triangle count. The conjecture is **false**: on July 23, 2026, Zyad Tamimi sent a 12-vertex counterexample with $\gamma_t(G) = 4$, $\mathrm{frequency}(t_{\min}(v)) = 1$ and $k = 2$, and the source now lists Conjecture 291 as refuted.

V2-000895 | Written on the Wall II - Conjecture 291 | conjecture291

research solved | proof annotation: False | 官方代码 | 原文线索

WOWII [Conjecture 291](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G with $n > 2$, $\gamma_t(G) \le k + \mathrm{frequency}(t_{\min}(v))$ where: - $\gamma_t(G)$ is the total domination number, - k is the first step in which a zero appears in the Havel-Hakimi process, - $\mathrm{frequency}(t_{\min}(v))$ is the number of vertices achieving the minimum triangle count. This is false: the source records a 12-vertex counterexample by Zyad Tamimi (July 23, 2026) with $\gamma_t(G) = 4 > 2 + 1 = k + \mathrm{frequency}(t_{\min}(v))$. The hypothesis $n > 2$ is stated in the source's full list of conjectures (as for the neighbouring Conjectures 290, 292 and 293) but omitted on its list of open conjectures; the counterexample has 12 vertices, so it refutes both readings.

WOWII [Conjecture 314](http://cms.uhd.edu/faculty/delavinae/research/wowII/all.html#conj314): For every finite simple connected graph G with $n > 1$ vertices, if G is triangle-free and $\mathrm{path}(G) \le 4$, then G is well totally dominated. Here $\mathrm{path}(G) = \mathrm{largestInducedPathSize}\, G$ is the **size of a largest induced path** in G, defined locally above. **Disambiguation.** Earlier revisions of this file used the `SimpleGraph.path` invariant, but that is the *floor of the average distance*, not the size of a largest induced path - a different quantity that makes Conjecture 314 vacuous in many cases. **Proof summary.** In a connected, K_{3}-free, induced-P_{5}-free graph G: 1. No minimal total dominating set has fewer than two vertices. 2. No minimal total dominating set has more than three vertices. 3. Minimal total dominating sets of sizes two and three cannot coexist. Thus, each minimal total dominating set in G has the same size. The Lean proof was generated by OpenAI GPT-5.6 Sol.

V2-000904 | Written on the Wall II - Conjecture 327 | conjecture327

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 327](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) Let `G` be a simple connected graph. If `3 · γ(G) = γ_i(G)`, then `G` is well totally dominated, where `γ(G)` is the domination number of `G` and `γ_i(G)` is the independent domination number of `G`. **Proof Sketch:** The conjecture states that if $3\gamma(G) = i(G)$ for a connected graph G, then G is well totally dominated. However, this conjecture is **FALSE**. **Counterexample:** Consider a graph G with 12 vertices: $u, v, a_0, a_1, a_2, a_3, a_4, b_0, b_1, b_2, b_3, b_4$. The edges are: - (u, v) - (u, a_i) for all $i \in \{0, 1, 2, 3, 4\}$ - (v, b_i) for all $i \in \{0, 1, 2, 3, 4\}$ - $(a_0, b_3), (a_1, b_3), (a_2, b_0), (a_3, b_0), (a_4, b_3), (a_4, b_4)$ Properties of G: 1. **Connected**: Yes, path exists between any two vertices through u and v. 2. **Domination Number $\gamma(G)$**: The set $\{u, v\}$ dominates all vertices. Since there is no universal vertex, $\gamma(G) = 2$. 3. **Independent Domination Number $i(G)$**: The minimum independent dominating set has size 6 (e.g., $\{u, b_0, b_1, b_2, b_3, b_4\}$). Thus $i(G) = 6$. 4. **Condition**: $3 \gamma(G) = 3 \times 2 = 6 = i(G)$. The condition holds. 5. **Well Totally Dominated**: A graph is well totally dominated if all minimal total dominating sets have the same size. - $\{u, v\}$ is a minimal total dominating set of size 2. - $\{v, b_0, b_3\}$ is a minimal total dominating set of size 3. Since $2 \neq 3$, G is NOT well totally dominated. The counterexample has been found by Moritz Firsching and Goran Žužić using an experimental pipeline.

WOWII [Conjecture 33](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $\operatorname{path}(G) \ge \lceil 2 \operatorname{dist}_{\operatorname{avg}}(M, V) \rceil$, where $\operatorname{path}(G)$ is the number of vertices of a largest induced path of G, M is the set of maximum-degree vertices, and $\operatorname{dist}_{\operatorname{avg}}(M, V)$ is the average of all nonzero distances $\operatorname{dist}_G(m, v)$ with $m \in M$ and $v \in V$. The conjecture is false: the source records an October 2005 counterexample with $\operatorname{path}(G) = 7$ and $\operatorname{dist}_{\operatorname{avg}}(M, V) = 3.56$.

```
theorem conjecture33 :
¬ ∀ (α : Type) [Fintype α] [DecidableEq α] [Nontrivial α]
(G : SimpleGraph α) [DecidableRel G.Adj] (h : G.Connected),
let M : Set α := {v | G.degree v = G.maxDegree}
let distAvg : ℝ :=

WOWII [Conjecture 34](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $\operatorname{path}(G) \ge \lceil \operatorname{dist}_{\operatorname{avg}}(C, V) + \operatorname{dist}_{\operatorname{avg}}(M, V) \rceil$, where $\operatorname{path}(G)$ is the number of vertices of a largest induced path of G, C is the set of center vertices (those with minimum eccentricity), M is the set of maximum-degree vertices, and $\operatorname{dist}_{\operatorname{avg}}(S, V)$ is the average of all nonzero distances $\operatorname{dist}_G(s, v)$ with $s \in S$ and $v \in V$. The conjecture is false. The counterexample below was documented by [Salvatore Mercuri](https://github.com/google-deepmind/formal-conjectures/pull/5733). Let G be the tree on 39 vertices formed by a vertex with three pendant leaves, joined by a path of five edges to the root of a perfect binary tree of depth four. Then $\operatorname{path}(G) = 11$, while C and M are singletons whose distance sums are 154 and 266, so the bound is $\lceil (154 + 266) / 38 \rceil = 12$. Lean formalization by Wentao Li, with AI assistance.

V2-000914 | Written on the Wall II - Conjecture 59 | conjecture59

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 59](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, the size $f(G)$ of a largest induced forest satisfies $f(G) \ge \lceil \sqrt{\mathrm{residue}(G) \cdot b(G)} \rceil$, where $\mathrm{residue}(G)$ is the Havel-Hakimi residue (the number of zeros remaining after applying the Havel-Hakimi algorithm to the degree sequence until termination) and $b(G)$ is the size of a largest induced bipartite subgraph. See: Favaron, Mahéo, Saclé (1991) for the residue; DeLaVina's Graffiti.pc for the conjecture. This conjecture is false. There is a connected counterexample on 123 vertices with `residue G = 101`, `b G = 122`, and `G.largestInducedForestSize = 111`. Indeed, `101 * 122 = 12322 = 111 ^ 2 + 1`, so the conjectured lower bound is 112. There is also an 18-vertex counterexample. Take a bipartite chain graph on vertices `0, ..., 9`, with parts `{0, ..., 4}` and `{5, ..., 9}`, a hub `10` adjacent to every core vertex, and leaves `11, ..., 17` attached at the hub. It has residue 10, `b = 17`, and largest induced forest 13. `⌈√170⌉ = 14`, so it falsifies the bound.

```

Written on the Wall II - Conjecture 65

MODULE CONTEXT: # Written on the Wall II - Conjecture 65 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Counterexample The conjecture is false. Start with the path $v_0-v_1-\cdots-v_{12}$ and attach one triangle at v_1 and another at v_{11}. The resulting graph has 17 vertices. Its Graph_6 string is `PhCGGC@?G?_@?@O?G?G?G?@C`. Its only minimum-degree vertices are v_0 and v_{12}, at distance 12, while its only maximum-degree vertices are v_1 and v_{11}, at distance 10. Thus the conjectured lower bound is $12 + \lceil 10/3 \rceil = 16$. Every induced forest must omit at least one vertex from each of the two vertex-disjoint triangles, so it has at most 15 vertices. Conversely, deleting one non-path vertex from each triangle leaves a tree on 15 vertices.

V2-000919 | Written on the Wall II - Conjecture 65 | conjecture65

research solved | proof annotation: False | 官方代码 | 原文线索

WOWII [Conjecture 65](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/): Does every simple connected graph G satisfy $f(G) \ge \operatorname{dist_min}(A) + \lceil \operatorname{dist_min}(M) / 3 \rceil$, where A is the set of minimum-degree vertices, M is the set of maximum-degree vertices, and $\operatorname{dist_min}(S)$ is the minimum distance between two distinct vertices of S (see `distMin`). The answer is no. `Counterexample.graph` has a conjectured lower bound of 16, but every induced forest in it has at most 15 vertices.

```
theorem conjecture65 :

WOWII [Conjecture 84](http://cms.uhd.edu/faculty/delavinae/research/wowII/all.html#conj84) (status O): For a simple connected graph `G` with positive minimum degree, `tree(G) ≥ 2 · rad(G) / δ(G)`, where `tree(G)` is the number of vertices in a largest induced subtree, `rad(G)` is the radius, and `δ(G) = G.minDegree` is the minimum degree. The hypothesis `0 < G.minDegree` follows from connectedness on a nontrivial vertex set, but is stated explicitly so the theorem reads as a real-valued inequality without `x / 0` corner cases.

```
theorem conjecture84 (G : SimpleGraph α) [DecidableRel G.Adj]
(h : G.Connected) (hδ : 0 < G.minDegree) :
2 * (G.radius.toNat : ℝ) / (G.minDegree : ℝ) ≤ (largestInducedTreeSize G : ℝ)
```

WOWII [Conjecture 96](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph `G` on at least two vertices, `α(G) ≤ 1 + min_v distEven(v) · (max_v I(v) - 1)` where `α(G) = G.indepNum` is the independence number, `distEven(v)` is the number of vertices at even distance from `v`, and `max_v I(v)` is the maximum independence number of a vertex neighbourhood. We record the nontrivial-graph version: the literal source inequality fails on K_1, where the independence number and even-distance count are both one, but the maximum local independence number is zero, giving $1 ≤ 0$.

```
theorem conjecture96 (G : SimpleGraph α) (h : G.Connected) :

Written on the Wall II - Conjecture 160

MODULE CONTEXT: # Written on the Wall II - Conjecture 160 *Reference:* [E. DeLaVina, Written on the Wall II, Conjectures of Graffiti.pc](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) ## Definitions For a vertex v in G, **$T(v)$** is the number of triangles incident to v: $$T(v) = |\{\{u, w\} \subseteq N(v) \mid u \sim w\}|$$ i.e., the number of pairs of neighbors of v that are themselves adjacent. The invariant `maxTrianglesAtVertex G` is the maximum of $T(v)$ over all vertices. Conjecture 160 uses both $\max_v T(v)$ and $\chi_{C_4}(G)$, the C_4-free characteristic function: it is `1` when G contains no cycle of length four and `0` otherwise. The cycle need not be induced. These invariants lower-bound the WOWII invariant $L_s(G)$, the maximum number of leaves over all spanning trees of G (exposed as `SimpleGraph.Ls G : ℝ`). The earlier formalization used the number of induced four-cycles. The historical conjecture instead uses this binary C_4-free indicator. **Provenance.** Statement corrected by Dominic Dabish.

V2-000926 | Written on the Wall II - Conjecture 160 | conjecture160

research solved | proof annotation: True | 官方代码 | 原文线索

WOWII [Conjecture 160](http://cms.dt.uh.edu/faculty/delavinae/research/wowII/) For a simple connected graph G, $L_s(G) \ge \max_v l(v) + \max_v T(v) \cdot \chi_{C_4}(G)$ where: - $L_s(G) = \mathrm{SimpleGraph.Ls}\, G$ is the maximum number of leaves over all spanning trees of G, - $\max_v l(v)$ is the maximum local independence number over vertices, - $\max_v T(v)$ is the maximum number of triangles incident to any vertex, - $\chi_{C_4}(G)$ is `1` if G has no cycle of length four and `0` otherwise. A formal proof uses the C_4-free neighborhood identity $d(v) = \lambda(v) + T(v)$ with a star/geodesic case analysis, routed through the connected-seed spanning-tree bound developed for Conjecture 2. An independent second proof, via a closest maximizer pair joined by a shortest path, is linked from the pull request that recorded the solution.

```
theorem conjecture160 (G : SimpleGraph α) [DecidableRel G.Adj] (h : G.Connected) :

Generic and maximal rank of 3-tensors

MODULE CONTEXT: # Generic and maximal rank of 3-tensors The rank of a tensor $T \in \mathbb{C}^{m_1} \otimes \mathbb{C}^{m_2} \otimes \mathbb{C}^{m_3}$ is the least r such that T is a sum of r decomposable tensors $a \otimes b \otimes c$. Mathlib records such a tensor as a `Holor ℂ [m₁, m₂, m₃]` and its rank as `Holor.cprank`. Two basic invariants of the format (m_1, m_2, m_3) are the *generic rank* $\operatorname{grank}(m_1, m_2, m_3)$, the rank of a generic tensor, and the *maximal rank* $\operatorname{mrank}(m_1, m_2, m_3)$, the largest rank attained by a tensor of that format. Counting parameters gives the lower bound $\operatorname{grank}(m_1, m_2, m_3) \geq r_0(m_1, m_2, m_3) := \lceil m_1m_2m_3 / (m_1 + m_2 + m_3 - 2) \rceil$. Once m_3 exceeds $(m_1-1)(m_2-1)$ the generic rank is known to be $\min(m_3, m_1m_2)$, so the interesting case is the *critical range* $3 \leq m_1 \leq m_2 \leq m_3 \leq (m_1-1)(m_2-1)$ [Fri12, Conjecture 5.1; BFZ24, (4.14)]. There the bound r_0 is attained in every case that has been settled, except for the formats $(3, 2p+1, 2p+1)$, where the generic rank is $r_0 + 1$. Friedland's conjecture, stated here as `isGenericRank_of_le_critical`, is that these are the only exceptions. The maximal rank is much less well understood. It is known for the formats $2 \times m \times n$ and for a range of small formats, but no formula is known even for (n, n, n), and $\operatorname{mrank}(3, 3, 5)$ is undetermined. Tensor rank is invariant under permuting the three factors, but `Holor ℂ [m₁, m₂, m₃]` and its permutations are different types and Mathlib has no transport lemma between them. Each statement below therefore writes the format in the order its own source uses. *References:* * [Fri12] S. Cunningham chains - Jones's conjecture

MODULE CONTEXT: # Cunningham chains - Jones's conjecture A Cunningham chain is a sequence of primes satisfying either $p_{i+1}=2p_i+1$ (first kind) or $p_{i+1}=2p_i-1$ (second kind). It is conjectured that there are infinitely many chains of every positive exact length, of both kinds. A chain has **exact length k** when its first k terms are prime and the $(k+1)$-th generated term is composite. Lenny Jones conjectures that for every positive integer k, infinitely many primes start a chain of exact length k, for each of the two kinds. *References:* - Lenny Jones, [Polynomial Cunningham Chains](https://arxiv.org/abs/1104.1579) - [OEIS A181697](https://oeis.org/A181697), first-kind chain lengths - [OEIS A181715](https://oeis.org/A181715), second-kind chain lengths

Conway's subprime Fibonacci sequences

MODULE CONTEXT: # Conway's subprime Fibonacci sequences A subprime Fibonacci sequence starts from two positive integers. Each new term is the sum of the previous two terms if that sum is prime; if the sum is composite, it is divided once by its least prime factor. This file formalizes the no-infinite-chains component of the conjecture: every such sequence eventually enters a cycle. It does not assert that the seven known loops are complete or unique. *References:* - R. K. Guy, T. Khovanova, and J. Salazar, ["Conway's subprime Fibonacci sequences"](https://arxiv.org/abs/1207.5099), *Mathematics Magazine* **87** (2014), no. 5, 323-337. - [A214897](https://oeis.org/A214897), Conway's subprime Fibonacci sequence: cycle lengths.

Ringel's Conjecture and Kotzig's Conjecture for large n

MODULE CONTEXT: # Ringel's Conjecture and Kotzig's Conjecture for large n *Reference:* [arxiv/2001.02665](https://arxiv.org/abs/2001.02665) **A proof of Ringel's Conjecture** by *Richard Montgomery, Alexey Pokrovskiy, Benny Sudakov* The original conjecture of Ringel (1963), which remains open, is stated in `Paper/RingelConjecture.lean`. The referenced paper proves it for all sufficiently large n. Montgomery-Pokrovskiy-Sudakov actually prove the strictly stronger statement conjectured by Kotzig: the decomposition can always be realized by cyclic shifts of a single copy of T. Kotzig's conjecture (all n) remains open; see `Paper/KotzigConjecture.lean`.

V2-000956 | Ringel's Conjecture and Kotzig's Conjecture for large n | kotzig_conjecture_large

research solved | proof annotation: False | 官方代码 | 原文线索

For all sufficiently large n, the complete graph K_{2n+1} decomposes into $2n+1$ edge-disjoint copies of any tree T with n edges via cyclic shifts of a single embedding. The $2n+1$ copies are $f_0, f_1, \dots, f_{2n}$ where $f_i(v) = f_0(v) + i$ for all vertices v - that is, each copy is obtained by adding $i \pmod{2n+1}$ to every vertex of the base copy. This is strictly stronger than `ringel_conjecture_large`. Kotzig conjectured this holds for all n; see `Paper/KotzigConjecture.lean`. Montgomery, Pokrovskiy, and Sudakov prove it for all sufficiently large n.

```
theorem kotzig_conjecture_large :
∀ᶠ (n : ℕ) in Filter.atTop, ∀ {V : Type} [Finite V] (T : SimpleGraph V),
T.IsTree → T.edgeSet.ncard = n →
∃ f : Fin (2 * n + 1) → (V ↪ Fin (2 * n + 1)),
(∀ i v, f i v = f 0 v + i) ∧
Pairwise (fun i j => Disjoint (T.map (f i)).edgeSet (T.map (f j)).edgeSet) ∧
⨆ i, T.map (f i) = (⊤ : SimpleGraph (Fin (2 * n + 1)))
```

FC-Arxiv.«2001.02665».kotzig_conjecture_large

V2-000957 | Ringel's Conjecture and Kotzig's Conjecture for large n | ringel_conjecture_large

research solved | proof annotation: False | 官方代码 | 原文线索

For all sufficiently large n, the complete graph K_{2n+1} decomposes into $2n+1$ edge-disjoint copies of any tree T with n edges. A "copy" of T is the image $T.\text{map}(f_i)$ of T under a vertex embedding $f_i : V \hookrightarrow \text{Fin}(2n+1)$; the copies are pairwise edge-disjoint and together cover every edge of K_{2n+1}. This follows from `kotzig_conjecture_large`; see `Paper/RingelConjecture.lean` for the open form.

```
theorem ringel_conjecture_large :
∀ᶠ (n : ℕ) in Filter.atTop, ∀ {V : Type} [Finite V] (T : SimpleGraph V),
T.IsTree → T.edgeSet.ncard = n →

The circulant Hadamard conjecture

MODULE CONTEXT: # The circulant Hadamard conjecture A circulant matrix is generated by cyclically shifting one row. The circulant Hadamard conjecture, also attributed to Ryser, says that no circulant Hadamard matrix has order greater than 4. *References:* * S. Steinerberger, [A note on approximate Hadamard matrices](https://arxiv.org/abs/2402.13202) * [OAI26a] OpenAI, *The circulant Hadamard conjecture*. Every circulant Hadamard matrix has order at most four. This was proved by an internal OpenAI model in September 2026 [OAI26a]; see the linked Lean proof, which shows that a real circulant Hadamard matrix of positive order n exists exactly when $n = 1$ or $n = 4$.

TxGraffiti [Conjecture 1](https://arxiv.org/abs/2507.17780): for every nontrivial connected graph G with $\Delta(G) \ge 2$, $$\alpha(G) \ge \frac{a(G) + R(G)}{\Delta(G)}.$$ This conjecture is **true**. **Proof sketch.** Substitute the Caro-Wei lower bound $\alpha \ge W$ for α and reduce to $a \le (\Delta - 1) \alpha$. The case $\Delta = 2$ is trivial ($a = \alpha$). For $\Delta \ge 4$ an AM-HM argument with $m \le (n - a)\Delta$ yields a quadratic whose discriminant is negative. For $\Delta = 3$ the annihilation number has a closed form in the degree counts (n_1, n_2, n_3) and $a \le 2W$ is verified in three regimes. See [arXiv:2606.29553](https://arxiv.org/abs/2606.29553).

TxGraffiti Conjecture 4: the saturation number versus the harmonic index

MODULE CONTEXT: # TxGraffiti Conjecture 4: the saturation number versus the harmonic index *Reference:* [arxiv/2507.17780](https://arxiv.org/abs/2507.17780) **In Reverie Together: Ten Years of Mathematical Discovery with a Machine Collaborator** by *Randy Davila, Boris Brimkov, Ryan Pepper* TxGraffiti is an automated conjecturing program, a successor of Fajtlowicz's *Graffiti* and DeLaViña's *Graffiti.pc*. Conjecture 4 in the cited collection asserts a bound between two graph invariants: * the *saturation number* $\mu^*(G)$ (`SimpleGraph.saturationNumber`), the minimum number of edges in a maximal matching of G; * the *harmonic index* $H(G)$ (`SimpleGraph.harmonicIndex`), $\sum_{uv \in E(G)} 2 / (\deg u + \deg v)$. The conjecture is **false**. It was first refuted by Bıyıkoğlu, who exhibited a family of counterexamples - a disjoint union of edges joined to an independent set - with unbounded ratio μ^*/H. That the smallest counterexample has order 9, namely the friendship graph F_4 formalised below, and that the windmill family has an exact limiting ratio, are established in Gupta. *References:* - [A Note on the TxGraffiti Conjecture about Harmonic Index and Minimum Maximal Matching Number](https://doi.org/10.46793/match.96-3.28425), Türker Bıyıkoğlu, *MATCH Commun. Math. Comput. Chem.* **96** (2026), no. 3, 1097-1099 - the first refutation. - [The saturation number is not bounded by the harmonic index](https://arxiv.org/abs/2606.15761), C. Gupta - the order-9 minimality of F_4 (formalised below) and the exact windmill limit.

V2-000981 | TxGraffiti Conjecture 4: the saturation number versus the harmonic index | tx_graffiti_conjecture_4

research solved | proof annotation: False | 官方代码 | 原文线索

TxGraffiti [Conjecture 4](https://arxiv.org/abs/2507.17780): for every nontrivial connected graph G, the saturation number is at most the harmonic index, $\mu^*(G) \le H(G)$. This conjecture is **FALSE**. **Counterexample.** The friendship graph F_4 (`friendshipF4`) is connected and nontrivial, with $\mu^*(F_4) = 4$ and $H(F_4) = 18/5$. Indeed the four rim edges $\{1,2\}, \{3,4\}, \{5,6\}, \{7,8\}$ form a maximal matching of size 4, and no maximal matching is smaller, so $\mu^*(F_4) = 4$; the eight spokes contribute $2/(8+2) = 1/5$ each and the four rim edges contribute $2/(2+2) = 1/2$ each, giving $H(F_4) = 8 \cdot 1/5 + 4 \cdot 1/2 = 18/5$. Since $4 > 18/5$, the bound fails. More generally the friendship graphs F_k satisfy $\mu^*(F_k) = k$ and $H(F_k) = 2k/(k+1) + k/2$, so the conjecture fails for every $k \ge 4$. An exhaustive search confirms that F_4 is the smallest counterexample (order 9). The unbounded separation was first shown by Bıyıkoğlu, whose family of edges joined to an independent set makes μ^*/H arbitrarily large; the windmill generalisation and its exact limit appear in [arXiv:2606.15761](https://arxiv.org/abs/2606.15761).

Conjecture 1.1 (Dean, 1988). For every integer $k \geq 3$, every finite simple graph with minimum degree at least k contains a cycle whose length is divisible by k. A cycle has length at least `3`, so the divisor is never `0` and the statement is not satisfied for a trivial reason. `SimpleGraph.minDegree` is `0` on a graph with no vertices and on a graph with no edges, so the hypothesis excludes both.

Fernandes' conjecture on the 2-generation of even direct product permutation groups

MODULE CONTEXT: # Fernandes' conjecture on the 2-generation of even direct product permutation groups *Reference:* [arxiv/2605.12342](https://arxiv.org/abs/2605.12342) **Groups of permutations that are even on maximal proper subsets, and related monoids** *Reference:* - [arxiv/2605.12342](https://arxiv.org/abs/2605.12342) **Groups of permutations that are even on maximal proper subsets, and related monoids** by *Vítor H. Fernandes* - [K26](https://github.com/KitaKen1/fernandes-conjecture-1-lean) For positive integers $m, n \ge 2$, let $\mathrm{S}_m \times \mathrm{S}_n$ be the direct product of symmetric groups on $[m] = \{1, \dots, m\}$ and $[n'] = \{1', \dots, n'\}$. Define $$ \Gamma_{m \oplus n} = \{(\sigma_1, \sigma_2) \in \mathrm{S}_m \times \mathrm{S}_n : \mathrm{sgn}(\sigma_1) = \mathrm{sgn}(\sigma_2)\} $$ to be the index-2 subgroup of pairs of permutations with equal parity, i.e., those whose product action on $[m] \cup [n']$ is an even permutation. It is known that $\mathrm{rank}(\Gamma_{2 \oplus 2}) = 1$, $\mathrm{rank}(\Gamma_{3 \oplus 3}) = 3$, $\mathrm{rank}(\Gamma_{4 \oplus 3}) = 3$, and $\mathrm{rank}(\Gamma_{4 \oplus 4}) = 3$. **Conjecture 1 (Fernandes, 2026):** For all integers $m \ge n \ge 2$ such that $(m, n) \notin \{(2,2), (3,3), (4,3), (4,4)\}$, the group $\Gamma_{m \oplus n}$ has rank 2 (i.e., is 2-generated).

V2-000990 | Fernandes' conjecture on the 2-generation of even direct product permutation groups | conjecture_1

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture 1 (Fernandes, 2026): Let $m \ge n \ge 2$ be integers with $(m, n) \notin \{(2,2), (3,3), (4,3), (4,4)\}$. Then the group $$ \Gamma_{m \oplus n} = \{(\sigma_1, \sigma_2) \in \mathrm{S}_m \times \mathrm{S}_n : \mathrm{sgn}(\sigma_1) = \mathrm{sgn}(\sigma_2)\} $$ has rank 2, i.e., minimal generating set of size 2. Note: Fernandes states the conjecture for groups of exact rank 2, which is why $(2,2)$ is in the exception list: $\Gamma_{2 \oplus 2} \cong C_2$ has rank 1. The formalised conclusion `∃ g₁ g₂, closure {g₁, g₂} = ⊤` encodes 2-generation (at most 2 generators), which $\Gamma_{2 \oplus 2}$ also satisfies. The other three exceptions $(3,3), (4,3), (4,4)$ have rank 3 and are genuinely not 2-generated. The proof was developed and formalized by Kenta Kitamura, see [K26] for more details.

Convexity of Fisher information along the heat flow

MODULE CONTEXT: # Convexity of Fisher information along the heat flow Can the functional $\mathcal{D}[f]$ be negative for an admissible density f? Equivalently, is the Fisher information of the Gaussian heat flow always convex in time? This is Problem (iii) of [ZFGW26, Section 7.3]; it is known in dimensions $d \le 4$ and left open for $d \ge 5$ [ZFGW26, Section 7.2]. References: - [ZFGW26] J. Zou, L. Fan, J. Gao and J. Wang, *A Hexagonal Counterexample to Log-Convexity of Fisher Information Along the Heat Flow*, arXiv:2605.18081 (2026). https://arxiv.org/abs/2605.18081 - [Ki26] K. Bondy's conjecture on longest cycles in highly connected graphs

MODULE CONTEXT: # Bondy's conjecture on longest cycles in highly connected graphs *References:* - [arxiv/2606.03696](https://arxiv.org/abs/2606.03696) **Longest cycles and Dirac-type results in highly connected graphs** by *Jie Ma, Bo Ning, Ziyuan Zhao*, where this is Conjecture 1. - [Bo80] Bondy, J. A., Longest paths and cycles in graphs of high degree. (1980). Take a `k`-connected graph with a large minimum degree. Bondy says that the graph outside any longest cycle holds no long path. The case `k = 1` is Dirac's theorem and the case `k = 2` is the theorem of Nash-Williams. The case `k = 3` is proved. The cases `k ≥ 4` are open.

V2-000992 | Bondy's conjecture on longest cycles in highly connected graphs | bondy_conjecture

research open | proof annotation: False | 官方代码 | 原文线索

Conjecture 1 (Bondy, 1980). Let $k \geq 1$ and let G be a k-connected graph on n vertices. If $\delta(G) \geq \frac{n + k(k-1)}{k+1}$, then for every longest cycle C of G, every path in $G - V(C)$ has at most $k-1$ vertices. The bound on the number of vertices of a path is written as `+ 1 ≤ k` rather than `≤ k - 1`, because subtraction on `ℕ` is truncated. The two forms agree for `k ≥ 1`. A longest cycle is a cycle whose length is the circumference of `G`.

```
theorem bondy_conjecture :
∀ (k : ℕ), 1 ≤ k → ∀ (V : Type) [Fintype V] [DecidableEq V]
(G : SimpleGraph V) [DecidableRel G.Adj], IsKConnected G k →
((Fintype.card V : ℝ) + k * (k - 1)) / (k + 1) ≤ G.minDegree →
∀ (a : V) (C : G.Walk a a), C.IsCycle → C.length = G.circumference →
∀ (u v : offWalk C) (P : (G.induce (offWalk C)).Walk u v), P.IsPath →
P.support.length + 1 ≤ k

research solved | proof annotation: False | 官方代码 | 原文线索

Theorem 3.8: the conjecture is known when the distance matrix is invertible, and the microscopic weighting is then the unique gauging.

```
theorem hasMicroscopicWeighting_iff_of_isUnit (h : IsUnit (distanceMatrix X).det) :
HasMicroscopicWeighting X ↔ HasFiniteConcentration (distanceMatrix X)
```

FC-Arxiv.«2607.05349».hasMicroscopicWeighting_iff_of_isUnit

V2-000998 | The microscopic weighting on a metric space | microscopic_weighting_iff_finite_concentration

research solved | proof annotation: True | 官方代码 | 原文线索

Conjecture 3.3 (Roff-Willerton, 2026). A finite metric space admits a microscopic weighting if and only if its distance matrix has finite concentration. `Nonempty` is needed and not just tidiness. On the empty space every gauging condition fails, since `∑ i, g i` is `0` rather than `1`, while `X → ℝ` is a subsingleton so the weighting converges trivially. The equivalence would be false there for reasons that have nothing to do with the question. The answer is false as proved by Kenta Kitamura assisted by ChatGPT 5.6 sol. The proof proceeds by constructing an explicit counterexample: a finite metric space on 10 points that has finite concentration but does not admit a microscopic weighting. The metric space is defined by the following 10×10 distance matrix A: $$ \begin{pmatrix} 0 & 116 & 236 & 231 & 260 & 124 & 64 & 290 & 266 & 64 \cr 116 & 0 & 312 & 268 & 296 & 112 & 64 & 280 & 296 & 64 \cr 236 & 312 & 0 & 68 & 40 & 236 & 288 & 68 & 36 & 288 \cr 231 & 268 & 68 & 0 & 34 & 237 & 288 & 72 & 40 & 288 \cr 260 & 296 & 40 & 34 & 0 & 264 & 320 & 40 & 68 & 320 \cr 124 & 112 & 236 & 237 & 264 & 0 & 64 & 280 & 264 & 64 \cr 64 & 64 & 288 & 288 & 320 & 64 & 0 & 312 & 320 & 120 \cr 290 & 280 & 68 & 72 & 40 & 280 & 312 & 0 & 40 & 312 \cr 266 & 296 & 36 & 40 & 68 & 264 & 320 & 40 & 0 & 320 \cr 64 & 64 & 288 & 288 & 320 & 64 & 120 & 312 & 320 & 0 \end{pmatrix} $$ The space has finite concentration, demonstrated by the explicit gauging g: $$ g = \frac{1}{24842973905} \begin{pmatrix} 3672468740 \cr 6389133731 \cr 9124217512 \cr 5612262448 \cr -6875621136 \cr 2754831248 \cr 0 \cr 10758780188 \cr -6593098826 \cr 0 \end{pmatrix} $$ which gives $A g = \frac{4111107017312}{24842973905} \mathbf{1}$. To prove that it does not admit a microscopic weighting, we provide a vector $v \in \ker A$: $$ v = \begin{pmatrix} -2 \cr -1 \cr 3 \cr 4 \cr -4 \cr -2 \cr 2 \cr 2 \cr -4 \cr 2 \end{pmatrix} $$ along with a row-space certificate q for the entrywise square matrix $B = A^{\circ 2}$ satisfying $q A = v^\top B$: $$ q^\top = \frac{1}{128472094291} \begin{pmatrix} 43681853675722 \cr -53873248293642 \cr -66890627544007 \cr -81187181670120 \cr 24308499983196 \cr 40819375894674 \cr 0 \cr 54690260644468 \cr 35226831040652 \cr 0 \end{pmatrix} $$ This certificate shows that the obstruction $v^\top B$ annihilates $\ker A$, making it impossible to construct a convergent weighting.

Finite generation of the cohomology of finite-dimensional Hopf algebras

MODULE CONTEXT: # Finite generation of the cohomology of finite-dimensional Hopf algebras Let A be a finite-dimensional Hopf algebra over a field k, and view k as an A-module through the counit. The cohomology ring $$H^*(A, k) = \mathrm{Ext}^*_A(k, k) = \bigoplus_{n \ge 0} \mathrm{Ext}^n_A(k, k)$$ is a graded-commutative k-algebra under the Yoneda product. The finite generation conjecture asserts that it is a finitely generated k-algebra, and that $\mathrm{Ext}^*_A(k, M)$ is a finitely generated module over it for every finite-dimensional A-module M. Etingof and Ostrik state it for every finite tensor category; the finite-dimensional modules over a finite-dimensional Hopf algebra form the main class of examples, and the conjecture is open already in this case. The conjecture is not due to any one author. The question for a finite-dimensional Hopf algebra was asked by a number of mathematicians and had circulated since at least the 1990s: Friedlander and Suslin record it while expressly declining to answer it ("We do not know whether it is reasonable to expect finite generation of the cohomology of an arbitrary finite dimensional Hopf algebra"), and Friedlander and Negron later describe the conjecture as having "existed as a question at least since the 90's" and as "recently stated explicitly in the work of Etingof and Ostrik". What Etingof and Ostrik contribute is that explicit statement, together with its extension from Hopf algebras to every finite tensor category; it is their Conjecture 2.18 that is formalised here. The conjecture holds when A is cocommutative, that is, when A is the group algebra of a finite group scheme (Friedlander-Suslin). For the group algebra $k[G]$ of a finite group G it is the theorem of Evens and Venkov, proved for a p-group by Golod. Etingof and Ostrik note that it also holds when A is commutative. Etingof and Ostrik work throughout the section containing the conjecture under the standing assumption that k is algebraically closed, whereas the statements below are for an arbitrary field. The generalisation is valid. For a field extension K/k one has $\mathrm{Ext}^*_{A \otimes_k K}(K, K) \cong \mathrm{Ext}^*_A(k, k) \otimes_k K$, because k admits a resolution by finitely generated free A-modules and K is flat over k; and finite generation descends, because the finitely many elements of $R = \mathrm{Ext}^*_A(k, k)$ occurring in a finite set of K-algebra generators of $R \otimes_k K$ generate a k-subalgebra R' with $R' \otimes_k K = R \otimes_k K$, whence $R' = R$ by faithful flatness. The same argument applies to the module statement. The theorems of Friedlander-Suslin and of Evens-Venkov are stated below over an arbitrary field because that is the generality in which they are proved. Ext is taken in the category of all A-modules rather than in the finite tensor category of finite-dimensional ones. For finite-dimensional A the two agree on finite-dimensional modules, as the module docstring of `FormalConjecturesForMathlib.RingTheory.Bialgebra.Cohomology` explains. *References:** * [arXiv:math/0301027](https://arxiv.org/abs/math/0301027) P. Independent proof of the stable equivalence. - [Bav20] [The Jacobian Conjecture implies the Dixmier Problem](https://arxiv.org/abs/math/0512250) by *Vladimir Bavula*; published in Springer Proceedings in Mathematics & Statistics 317 (2020). A third proof. - [Alp26] [Counterexample to the Jacobian conjecture](https://x.com/__alpoge__/status/2079028340955197566) by *Levent Alpöge* (2026), disproving the Jacobian conjecture in dimension 3 - [Lon26] [An Explicit Counterexample to the Rank-Two Poisson Conjecture](https://arxiv.org/abs/2608.23777) by *Christopher D. Long* (2026), disproving PC_2 The Dixmier Conjecture DC_n asserts that, over a field `K` of characteristic zero, every endomorphism of the `n`-th Weyl algebra $A_n(K)$ is an automorphism. For $n = 1$ this is Problem 1 of [Dix68] and remains open. By [BCW82], $DC_n \Longrightarrow JC_n$ (the Jacobian conjecture in dimension `n`) over a fixed field `K`. By [AvdE07], Theorem 7, the chain $$JC_{2n} \Longrightarrow PC_n \Longrightarrow DC_n \Longrightarrow JC_n$$ holds when each conjecture is quantified over all fields of characteristic zero ([AvdE07], Notations 5 and 7). Since the Jacobian conjecture fails in every dimension $n ≥ 3$ [Alp26], the contrapositive of [BCW82] gives that DC_n is **false for all $n ≥ 3$**. DC_1 and DC_2 remain open. The chain only propagates falsity upwards, so the failure of PC_2 [Lon26] does not settle DC_2. The Weyl algebra $A_n(K)$ is `WeylAlgebra K (Fin n)`, with the $2n$ generators indexed by `Fin n ⊕ Fin n` as in `FormalConjecturesForMathlib/Algebra/WeylAlgebra.lean`; the Poisson side of the chain is stated in `PoissonConjecture.lean` in this directory.

The Poisson Conjecture

MODULE CONTEXT: # The Poisson Conjecture *References:* - [AvdE07] [arxiv/math.0608009](https://arxiv.org/abs/math/0608009) **On the equivalence of the Jacobian, Dixmier and Poisson Conjectures in any characteristic** by *Kossivi Adjamagbo, Arno van den Essen*. Published as *A proof of the equivalence of the Dixmier, Jacobian and Poisson conjectures*, Acta Math. Vietnam. 32 (2007), 205-214. - [BCW82] [The Jacobian conjecture: reduction of degree and formal expansion of the inverse](https://doi.org/10.1090/S0273-0979-1982-15032-7) by *Hyman Bass, Edwin H. Connell, David Wright*, Bull. Amer. Math. Soc. 7 (1982), 287-330. - [Alp26] [Counterexample to the Jacobian conjecture](https://x.com/__alpoge__/status/2079028340955197566) by *Levent Alpöge* (2026), disproving the Jacobian conjecture in dimension 3 - [Lon26] [An Explicit Counterexample to the Rank-Two Poisson Conjecture](https://arxiv.org/abs/2608.23777) by *Christopher D. Long* (2026), disproving PC_2 The Poisson Conjecture PC_n ([AvdE07], Notations 5) asserts that, over a field of characteristic zero, every endomorphism of the `n`-th canonical Poisson algebra $P_n(K)$ - the polynomial algebra $K[X_1, \dots, X_{2n}]$ equipped with the canonical Poisson bracket - is an automorphism. By [AvdE07], Theorem 7 (the "United Conjectures Theorem"), for every `n` there is a chain of implications $$JC_{2n} \Longrightarrow PC_n \Longrightarrow DC_n \Longrightarrow JC_n,$$ where JC_n is the Jacobian Conjecture in dimension `n` and DC_n the Dixmier Conjecture for the `n`-th Weyl algebra (the implication $DC_n \Longrightarrow JC_n$ being classical [BCW82]). Since the Jacobian conjecture was disproved in dimension 3 [Alp26] - and hence in every dimension $n \geq 3$ by padding with identity coordinates - PC_n is false for all $n \geq 3$: composing the counterexample's failure of JC_3 through $PC_3 \Longrightarrow DC_3 \Longrightarrow JC_3$ refutes PC_3, and directly, the cotangent (symplectic) lift of the counterexample map ([AvdE07], Theorem 1 in reverse) is a non-invertible Poisson endomorphism of $P_3(K)$. PC_2 is false as well, by the explicit rank-two counterexample of [Lon26]. Only $n = 1$ remains open. Indexing note: we index the $2n$ variables of $P_n(K)$ by `Fin n ⊕ Fin n`, with `Sum.inl i` playing the role of X_i and `Sum.inr i` the role of X_{i+n} of [AvdE07], so that the canonical bracket reads $\{X_i, X_{i+n}\} = 1$; see `MvPolynomial.poissonBracket`.

Algebraic consequences of the Farrell-Jones conjecture

MODULE CONTEXT: # Algebraic consequences of the Farrell-Jones conjecture The assembly map in the Farrell-Jones conjecture is not yet available in Mathlib. This file states two of its algebraic consequences using projective modules and matrices over group rings: the vanishing of the reduced projective class group and the Bass conjecture for commutative integral domains. *Reference:* - [BLR08] [arxiv/math.0703548](https://arxiv.org/abs/math/0703548) **On the Farrell-Jones Conjecture and its applications** by *Arthur Bartels, Wolfgang Lück, Holger Reich*, J. Topol. 1 (2008), 57-86.

V2-001015 | Algebraic consequences of the Farrell-Jones conjecture | bass_conjecture_integral_domain

research open | proof annotation: False | 官方代码 | 原文线索

Bass conjecture for commutative integral domains, in idempotent-matrix form. Let `A` be an idempotent matrix over `R[G]`. If the order of `g` is not invertible in `R`, then the Hattori-Stallings trace of the projective module represented by `A` vanishes at the conjugacy class of `g`. This includes every infinite-order `g`, whose `orderOf` is zero. This is Conjecture 0.6 of [BLR08]. By Theorems 0.5 (ii) and 0.7 of [BLR08] it follows from the Farrell-Jones conjecture with coefficients in every field of prime characteristic.

```

V2-001016 | Algebraic consequences of the Farrell-Jones conjecture | projective_module_isStablyFree

research open | proof annotation: False | 官方代码 | 原文线索

Vanishing of the reduced projective class group for integral group rings. If `G` is torsion-free, that is, if its only element of finite order is `1`, then every finitely generated projective module over `ℤ[G]` is stably free. This is the stable-freeness form of the vanishing of $\widetilde K_0(\mathbb{Z}[G])$, which is the conclusion of Theorem 0.2 (ii) of [BLR08] for the regular ring $\mathbb{Z}$. That theorem assumes the K-theoretic Farrell-Jones conjecture for `G` with coefficients in `ℤ`.
